

# VSC HPC Introduction

ICTS KU Leuven

VSC staff:

Mag Selwa

Ehsan Moravveji

Wouter van Assche

Geert Jan Bex (UHasselt)

Jan Ooghe

# What is High Performance Computing?

- Using supercomputers to solve advanced computation problems
- Reduce the computation time from days, years, decades, or centuries to minutes, hours, days, or weeks
- The key is parallelism
- Access to specialized hardware (GPU, large memory, high-speed interconnect)

# In practice, it is more like ...

The concept is simple: **Parallelism** = employing multiple processors for a single problem

Home About VSC Systems & Services Showcase News & Events VSC Training User Portal Access

#### Welcome to the User Portal

Here you can find the gateway to the User documentation of the Vlaams Supercomputer Centrum

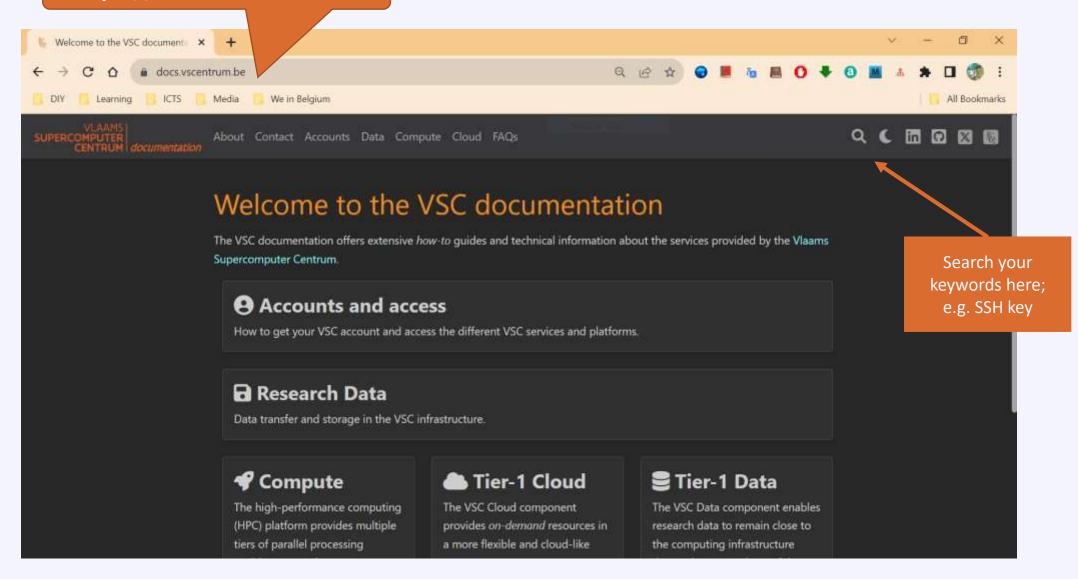

User documentation page

Manage your VSC-account

partner institute account required

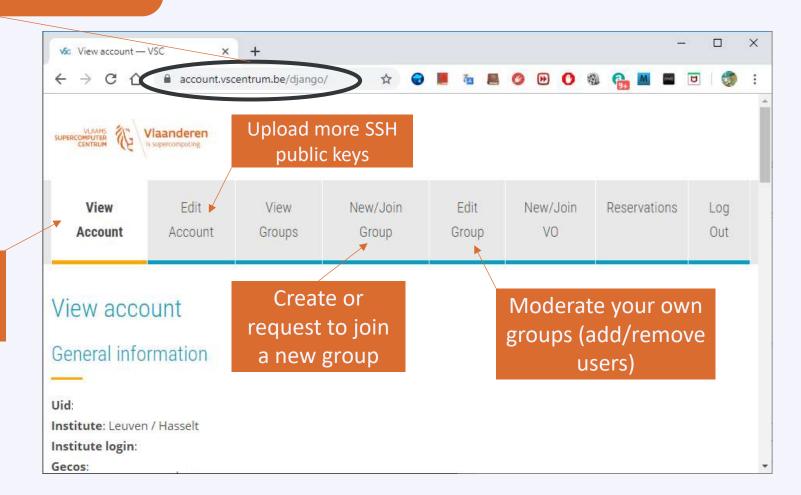

VSC account page

#### https://docs.vscentrum.be

# To manage your VSC account:

account.vscentrum.be

Upload SSH Key Request account

### Support and Services

Basic support

- Helpdesk (<a href="https://hpcinfo@kuleuven.be">hpcinfo@kuleuven.be</a>)
- Monitoring and reporting

Application support

- Installation and porting
- Optimisation and debugging
- Benchmarking
- Workflows and best practices

**Training** 

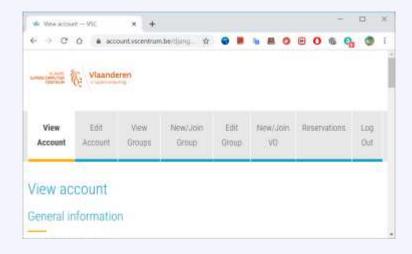

- Documentation and tutorials
- Scheduled trainings / workshops
- On request workshops
- One-to-one sessions

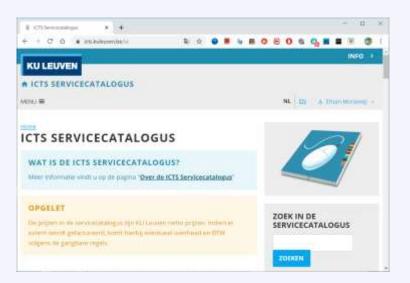

### Become a VSC user

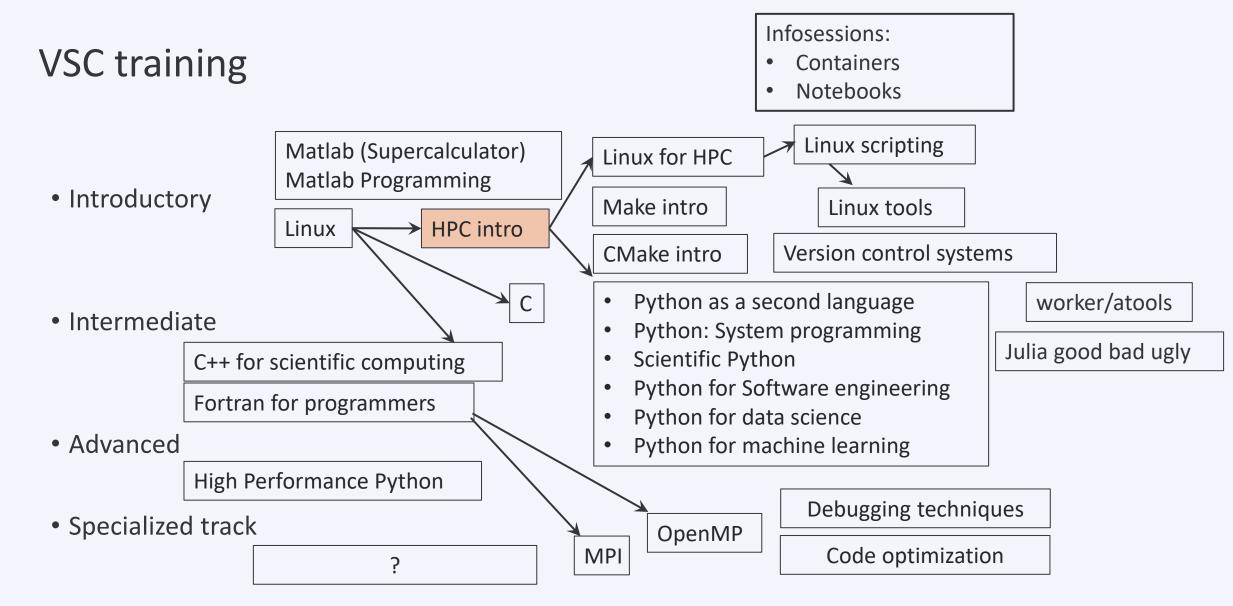

- ☐ (Optional) Create a secure (4096 bit) <u>SSH key pairs</u>
  Upload it on the account page: <u>www.account.vscentrum.be</u>
- You need to <u>request a VSC account</u> Normally processed swiftly
- ☐ Request <u>introductory credits</u> (2M free credits for 6 months)
- Request <u>project credits</u> (for supervisors and project leaders)
  You need to create a VSC group
  Add users to the group to give them access to use credits
- Extra storage requestsScratch extension: free of charge

Fill out the request form

☐ All service costs (compute and storage) are all explained Go to ICTS service catalogus: <a href="https://icts.kuleuven.be/sc">https://icts.kuleuven.be/sc</a> Click on High Performance Computing (NL/EN)

Stay up-to-date <a href="https://www.vscentrum.be/en/education-and-trainings">https://www.vscentrum.be/en/education-and-trainings</a>

### To Acknowledge VSC in publications

#### Why?

- a contractual obligation for the VSC
- helps VSC secure funding
- you will benefit from it in the long run

#### At KU Leuven

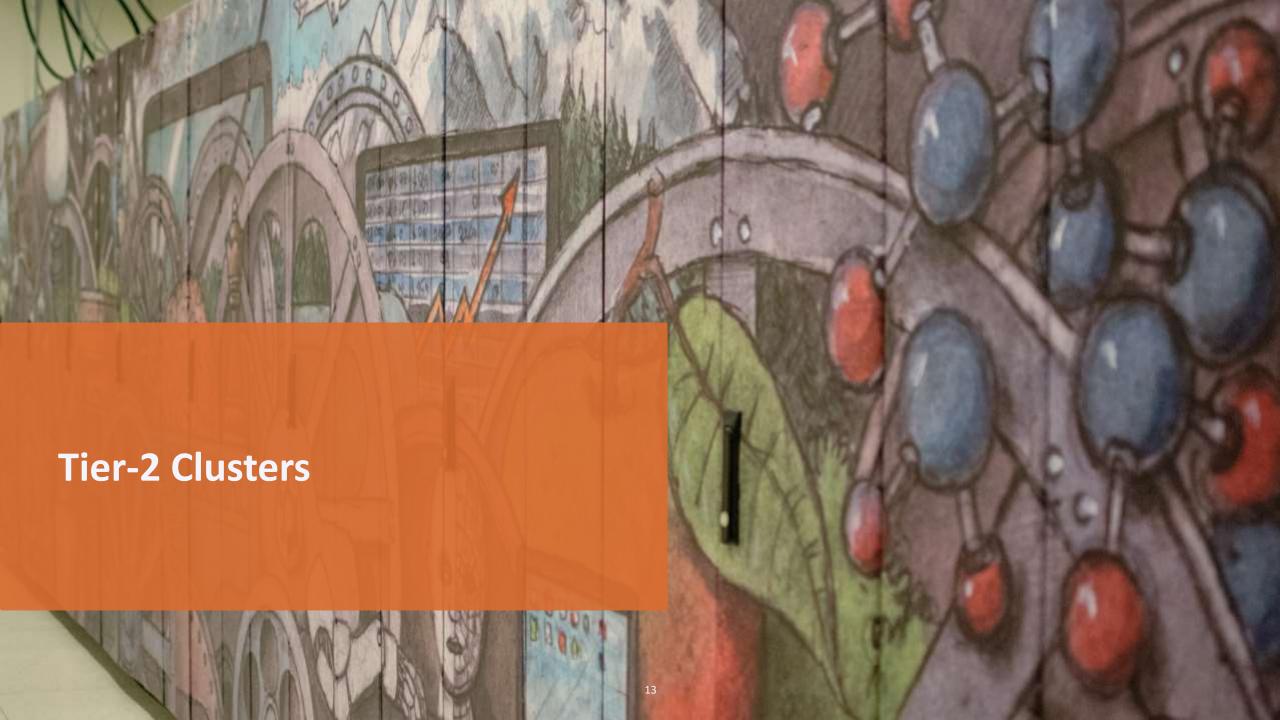

add the relevant papers to the virtual collection "High Performance Computing" in Lirias

#### In het nederlands

De rekeninfrastructuur en dienstverlening gebruikt in dit werk, werd voorzien door het VSC (Vlaams Supercomputer Centrum), gefinancierd door het FWO en de Vlaamse regering – departement EWI.

#### In English

The computational resources and services used in this work were provided by the VSC (Flemish Supercomputer Center), funded by the Research Foundation - Flanders (FWO) and the Flemish Government – department EWI.

### **VSC** HPC Environments

Tier-1

# **Hortense**

**GENIUS/WICE** 

# Tier-2 Clusters @ KU Leuven

**Genius** (since 2018) 250 nodes: 8,936 cores

**wICE** (since 9/2022) 186 nodes; 13,392 cores

### Tier-2 Cluster - Genius

Node type	CPU type	# cores	Total mem	Mem per core (MB)	Partition
Cascadelake	Xeon Gold 6240	36	192 GB	5000	batch
Skylake large mem	Xeon Gold 6240	36	768 GB	21000	bigmem
Skylake <b>GPU</b>	Xeon Gold 6140 <b>4xP100</b> SXM2 16GB	36	192 GB	5000	gpu_p100
Cascadelake <b>GPU</b>	Xeon Gold 6240 <b>8xV100</b> SXM2 32GB	36	768 GB	21000	gpu_v100
Superdome	Xeon Gold 6132 8 sockets	112	6 TB	53500	superdome

o End of life: end 2024

o SSD Disks: 200 GB

Remarks

o **Access:** login.hpc.kuleuven.be

Interconnect: InfiniBand EDR (25 Gb/s)

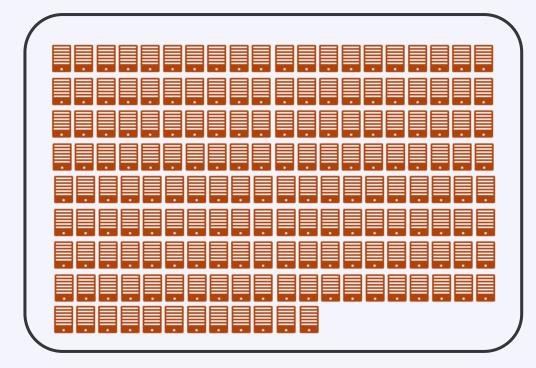

### Tier-2 Cluster - wICE

Node type	CPU type	# cores	Total mem	Mem per core (MB)	Partition
Icelake	Xeon 8360Y	72	256 GB	3455	batch_icelake
Sapphire Rapids	Xeon 8468	96	256 GB	2500	batch_sapphirera pids
Icelake large mem	Xeon 8360Y	72	2 TB	28000	bigmem
Icelake large mem	Xeon 8360Y	72	8 TB	111900	hugemem
Icelake <b>GPU</b>	Xeon 8360Y <b>4xA100</b> SXM2 80GB	72	512 GB	7000	gpu_a100
AMD <b>GPU</b>	Epyc 9334 <b>4xH100</b> SXM5 80GB	64	768 GB	11700	gpu_h100
Icelake Interactive	Xeon 8358 <b>1xA100</b> SXM2 80GB	64	512 GB	7500	interactive

<ul> <li>Phase 1: since September 2022</li> </ul>	<ul> <li>SSD Disks: 960 GB</li> <li>Remarks</li> </ul>
<ul> <li>Access: login.hpc.kuleuven.be</li> </ul>	O Interactive partition:
<ul> <li>Interconnect: InfiniBand HDR (100 Gb/s)</li> </ul>	max resources: 8 cores, 1 GPU, 16hr

### Tier-2 Cluster - wICE

#### **Compute nodes**

172x IceLake 72c 256 GB

#### Large memory nodes

5x IceLake 72c 2048 GB

#### **Interactive nodes**

4x IceLake 64c 512 GB 1 A100 80GB

#### **GPU** nodes

4x IceLake 72c 512 GB 4 A100 SXM4 80GB

### Tier-2 Cluster – wICE extension

#### **Compute nodes**

68x Sapphire Rapids 96c 256 GB

#### Large memory nodes

1x IceLake 72c 8 TB

#### **GPU** nodes

4x AMD Genoa 64c 768 GB 4x H100 SXM5 80GB

### Overview of the storage infrastructure

- Only you own your files (POSIX)
  Users can share folders via <a href="VSC groups">VSC groups</a>
- A VSC account has 3 default storages (free of charge)
  - \$VSC HOME
  - \$VSC DATA
  - \$VSC SCRATCH
- You can additionally request staging storage
- Different storage volumes have different:
  - mount point
  - size and performance
  - use case
  - backup and maintenance policy
- More info on <a href="ICTS Service Catalog">ICTS Service Catalog</a> (EN/NL)

☐ Do NOT use /tmp

It is only 10 GB and is reserved for the OS and root processes.

Your application can crash if using / tmp

- You are automatically logged into your home folder upon login.
  - Immediately go to your other storages, e.g.

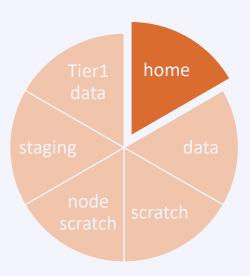

\$ cd \$VSC\_DATA

■ Always check your storage balance using myquota command

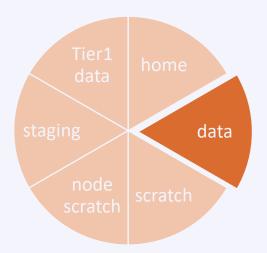

#### Example

```
$ myquota
file system $VSC_HOME
    Blocks: 1479M of 3072M
    Files: 12934 of 100k
file system $VSC_DATA
    Blocks: 12G of 75G
    Files: 1043k of 10000k
file system $VSC_SCRATCH
    Blocks: 15M of 1.5T
```

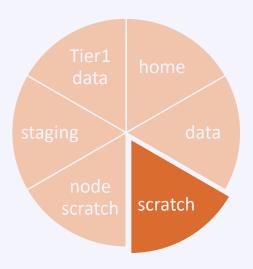

- Request form for extra storage
- More information

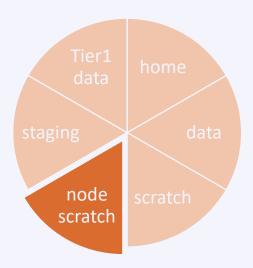

Storage	home folder
Env. Variable	\$VSC_HOME
Filesystem Type	NFS
Access	Global
Backup	Hourly, daily, weekly (until last month) inside the .snapshot folder.
Default Quota	3 GB
Extension	Not possible
Usage	Only storing SSH keys, config files
Remarks	<ul><li>Stay away from using it</li><li>Can easily overflow:</li><li>+ Your jobs may crash</li><li>+ Login issues</li></ul>

Storage	data folder
Env. Variable	\$VSC_DATA
Filesystem Type	NFS
Access	Global
Backup	Hourly, daily, weekly (until last month) inside the .snapshot folder.
Default Quota	75 GB
Extension	On purchase
Usage	Your data, code, software, results
Remarks	<ul> <li>Permanent storage for initial/final results</li> <li>Not optimal for intensive or parallel I/O</li> </ul>

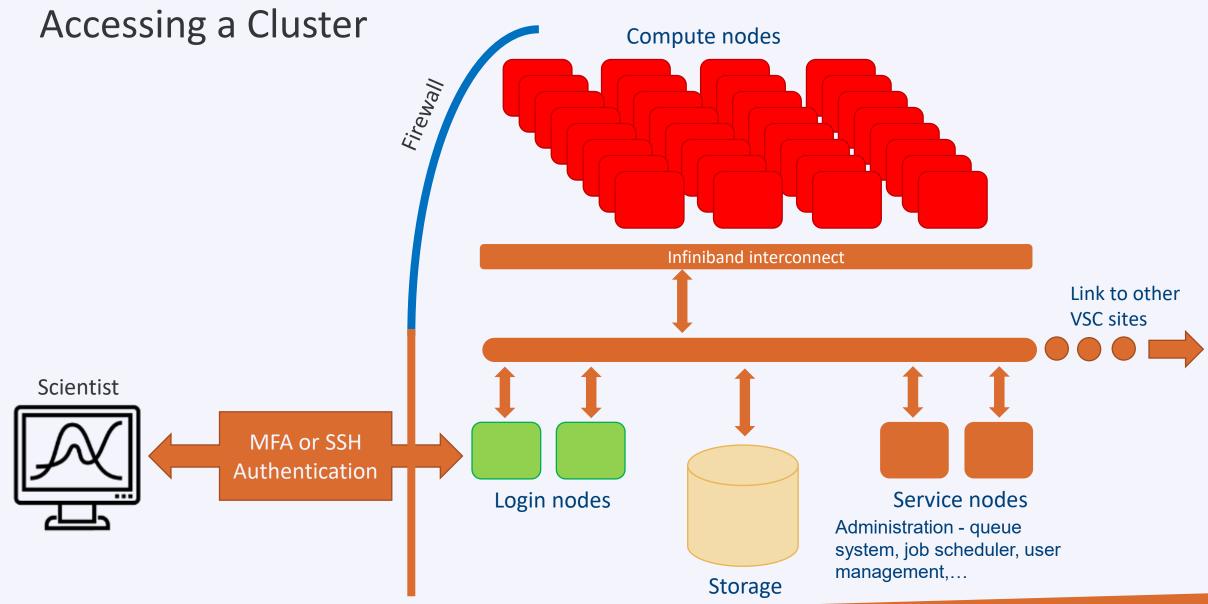

Storage	scratch folder
Env. Variable	\$VSC_SCRATCH
Filesystem Type	Lustre
Access	Local
Backup	delete after 30 days from last access
Default Quota	500 GB
Extension	Free
Usage	Intensive, parallel I/O, temporary files
Remarks	<ul> <li>Recommended storage for all jobs</li> <li>Copy scratch files to VSC_DATA or local storage after jobs are done</li> <li>Deleted files cannot be recovered</li> </ul>

Storage	Node scratch folder
Env. Variable	\$VSC_SCRATCH_NODE
Filesystem Type	Lustre
Access	On compute node, only at runtime
Backup	None
Default Quota	591 GB
Extension	Read about beeOND
Usage	Temporary storage at runtime
Remarks	<ul> <li>Fastest I/O, attached to the node</li> <li>Is cleaned after job terminates</li> <li>Copy the data to your home, scratch, or staging before job ends</li> </ul>

# How to login?

#### Open OnDemand

- Web-based login via browser
- https://ondemand.hpc.kuleuven.be
- Multi-Factor Authentication (MFA): Login first to your institute/university
- ☐ No SSH-key needed

#### NX

- Graphical desktop
- Using NoMachine client
- Using GUI (Matlab, SAS, visualization)
- Nvidia Quatro GPU for visualization

#### SSH client

■ Windows: <u>PuTTY</u>, <u>MobaXterm</u>, NoMachine

MacOS/Linux: terminal, NoMachine

- ☐ Requires (open)SSH keys
- ☐ Upload your key to VSC account page wait at least 30 minutes
- Hosts: login.hpc.kuleuven.be:22 nx.hpc.kuleuven.be (NX)
- ☐ Use <u>SSH agent</u> (recommended)
  Use <u>SSH Config</u> (recommended)
- ☐ Can open GUIs if X11 is configured

### Using Login Nodes

☐ To develop code Tips To check your storage and credit balance To manage jobs (submit, check status, debug, resubmit, ...) To move data around within VSC: use data, scratch, staging outside VSC: copy/sync from/to your local storage (e.g. Globus) ☐ To pre-/post-process your data/jobs To visualize your data To share files/folders

### Do NOT execute heavy-lifting tasks (core, memory)

Warning

Login nodes are shared resources

Instead, submit jobs: e.g. Compile your software on compute nodes.

Check \$ slurmtop to see how busy the cluster is

### SSH overview

#### Private keys are always secret

- Anyone who can access your private key can log in as you!
- Set a passphrase on your private key
- Private key is encrypted with this passphrase
- Always a pair of keys is needed
- Both keys need to be generated together

#### Linux/Mac OS users:

- Use "ssh-keygen" command to generate key pair
- Be sure to give your key a passphrase!
- Requested ssh key format: RSA 4096 bit

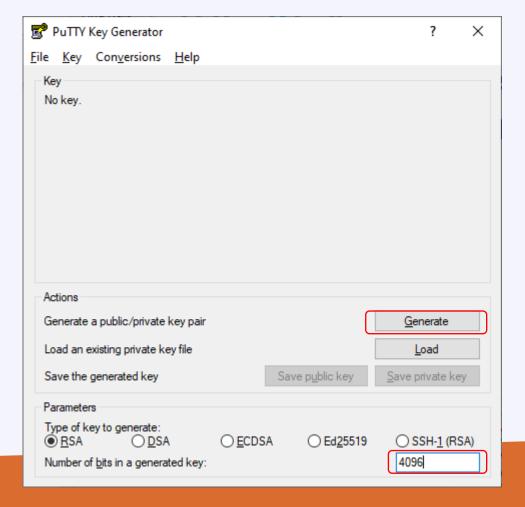

```
user@desktop:~> ssh-keygen -t rsa -b 4096
Generating public/private rsa key pair.
Enter file in which to save the key (/home/user/.ssh/id_rsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/user/.ssh/id_rsa.
Your public key has been saved in /home/user/.ssh/id_rsa.pub.
The key fingerprint is:
f6:61:a8:27:35:cf:4c:6d:13:22:70:cf:4c:c8:a0:23
```

#### Linux/Mac OS users:

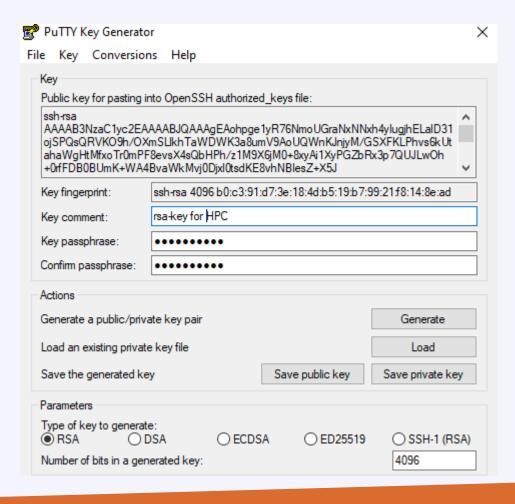

- Use "ssh-keygen" command to generate key pair
- Be sure to give your key a passphrase!
- Default location: ~/.ssh/id\_rsa (~/.ssh/id\_rsa.pub)
- If other location: ssh -i localtion-of-the-file .....
- keychain: ssh agent to load the key with passphrase for current linux session

Windows users: use the PuTTYgen key generator.

Request ssh key format: RSA 4096 bit

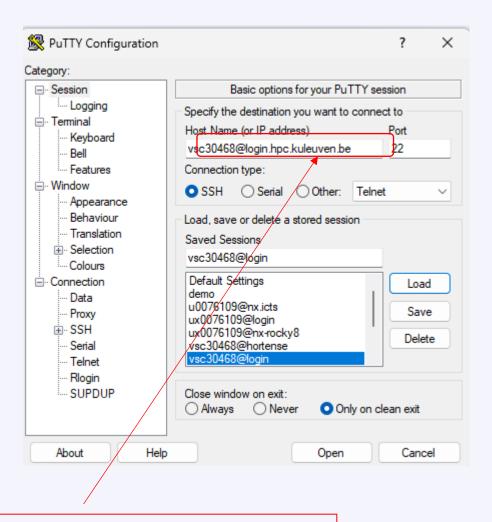

### Be sure to give your key a passphrase!

# Connecting to the cluster: text mode

#### Windows users:

- PuTTY is a simple-to-use and freely available GUI SSH client for Windows.
- Pageant can be used to manage active keys for PuTTY, WinSCP and FileZilla so that you don't need to enter the passphrase all the time.

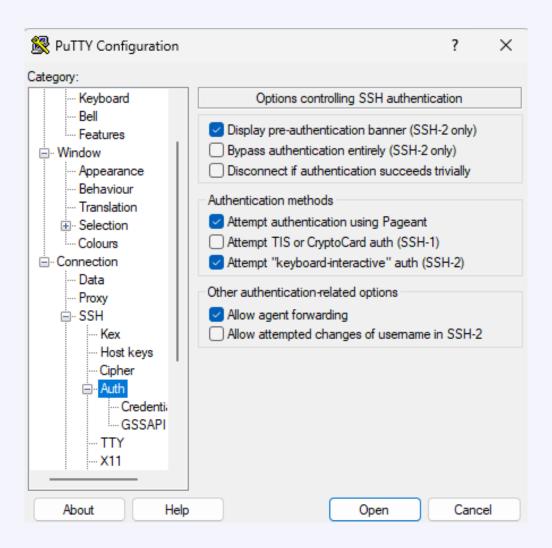

vsc3XXXX@login.hpc.kuleuven.be

## Connecting to the cluster: text mode

#### Windows users:

 PuTTY is a simple-to-use and freely available GUI SSH client for Windows.

## Connecting to the cluster: text mode

#### Windows users:

If asked for password
no for passphrase –
please stop
connecting and
contact suport,
otherwise after a few
attempts you will be
blocked for 24hrs

## Connecting via Terminal

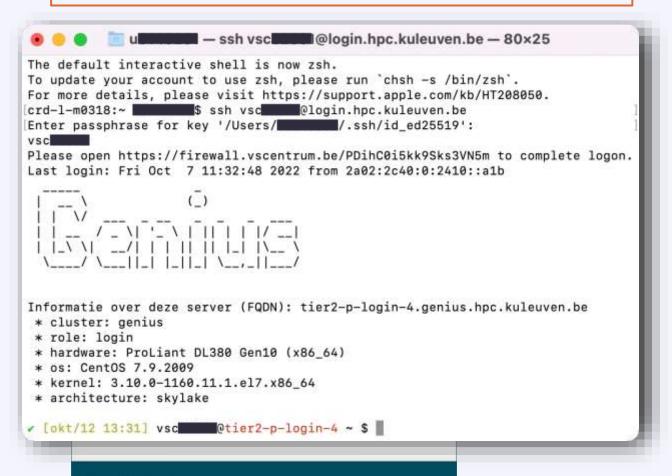

(Linux and Mac)

- ✓ Use ssh to connect:

  \$ ssh vscXXXXX@<host name>
- \$ If key not found:
  \$ ssh -i </path/to/keyfile> ...

If asked for **password**, please stop connecting and contact support, otherwise after a few attempts you will be blocked for 24h.

# Host Name: login.hpc.kuleuven.be

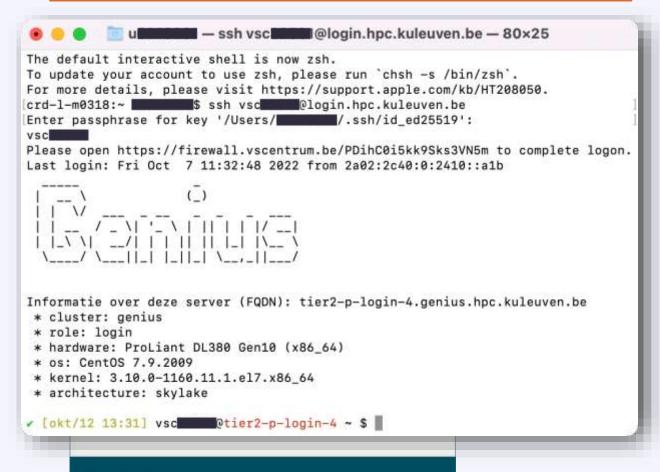

## Connecting via Terminal (Linux and Mac)

#### With SSH Agent

- Check your SSH Agent.
  Is your SSH key found?
  \$ ssh-add -1
- ✓ If your SSH Agent is not running:
  eval \$(ssh-agent)
- If your key is not found,
  add it to the Agent:
  \$ ssh-add </path/to/keyfile>
- ✓ Use ssh to connect (MFA):

  \$ ssh -A vscXXXXX@<hostname>

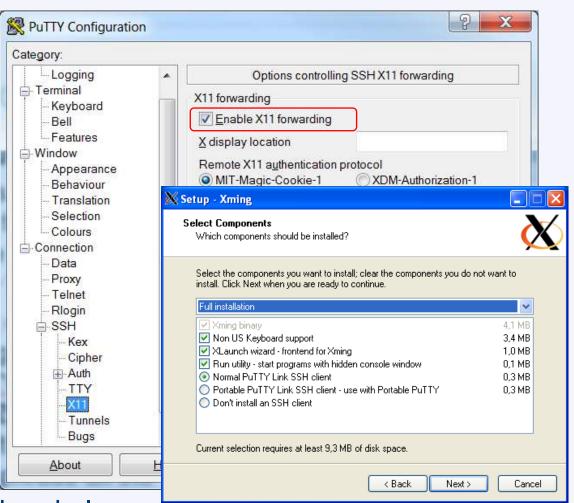

# Host Name: login.hpc.kuleuven.be

## Connecting to the cluster: display graphics

#### Windows users:

- PuTTY is a simple-to-use and freely available GUI SSH client for Windows.
- Pageant can be used to manage active keys for PuTTY
- Xming: using X-windows to display graphical programs

#### **Linux users:**

ssh -X vsc3XXXX@login.hpc.kuleuven.be

#### Command Line

- Text mode
- Provides a way to control the computer via the keyboard.
- Is common use on HPC
- Is somewhat archaic, but very powerful.
- Can be much quicker than a GUI.
- Implicitly assumes that you know what your are doing
- Don't be scared!
- If anything goes wrong, you can stop the command with Ctrl+C

```

```

#### Important rules on the command line

- 1. Linux systems are case (and space) sensitive.
  - MyFile is not same as myfile
- 2. There is no "recycle bin" or "trash can" when working in the command line environment. There might be one for GUI.

  When files are deleted on the command line, they instantly disappear forever.
- 3. You should always practice new commands on a test system that is not used in a production environment. This minimizes the chances of an accident that can take down an important system

#### Important rules on the command line

- "\" vs. "/":
  - In Linux, the "/" is the directory separator, and the "\" is an escape character.
  - In Windows, the forward-slash "/" is the command argument delimiter, while the backslash "\" is a directory separator

#### • Filenames:

- In Linux, there is no such thing as a file extension.

  Periods can be placed at any part of the filename, and "extensions" may be interpreted differently by all programs, or not at all.
- Windows uses the ".extension" filename convention, (e.g. FILENAME.TXT).

## Getting help: command built-in

- Help on most Linux commands is typically built into the command themself
- These flags usually look like "-h" or "--help".
- •\$ ls --help

```
frank@frank-laptop: ~

File Edit View Terminal Help

frank@frank-laptop:~$

A
```

#### Getting help: man pages

• Best source of information can be found in the online manual pages, "man pages" for short.

```
type "man command".
$ man grep
```

- Tips:
  - To search for a particular word (e.g. file) within a man page, type "/word".
  - To quit from a man page, type the "q" key.
  - If you do not remember the name of Linux command and you know a keyword relating to the command, search the man pages with the -k

```
$ man -k control
```

## Getting help: info pages

- Info pages are similar to man page, but instead of being displayed on one long scrolling screen, they are presented in shorter segments with links to other pieces of information.
- Access with the "info" command \$ info ls
- Tips:
  - To quit from a info page, type the "q" key.
  - Type "h" to get more help on the info

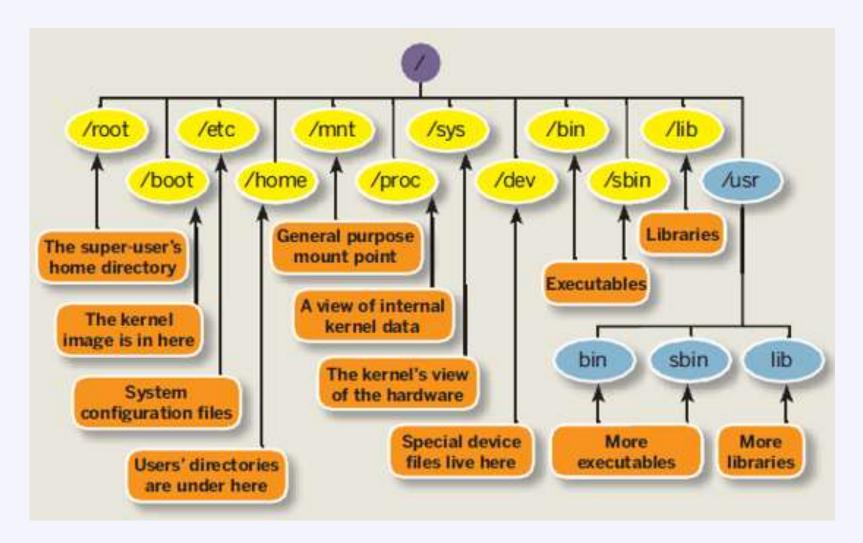

## Getting help

- bash has a built-in help facility available for each of the shell builtins.
  - \$ help cd
  - \$ help pwd
- whatis displays a very brief description of a command
  - \$ whatis pwd

#### Useful commands

- Clear the contents of the current screen
  - \$ clear
- \$ logout
  - The logout command logs your account out of the system (in a text mode).
  - This will end your terminal session and return to the login screen.
  - Some systems may have a file called .logout or .bash\_logout in each user's home directory.
- •\$ exit
  - Exit the current shell. The exit command is similar to the logout command with the exception that it does not run the logout script located in the user's home directory.

- hierarchical directory structure: files are organized in a tree-like pattern of directories (folders), which may contain files and other directories, etc.
- Everything is a file:
  - Regular files
  - Directories: files listing a set of files
  - Symbolic links: files referring to the name of another file
- root /: the first directory in the file system.
- Note: comparison with Windows,
  - Windows has a separate file system tree for each storage device (e.g. C-drive, D-drive, I-drive, ...)
  - Linux has a single file system tree, regardless of how many drives or storage devices are attached to the computer.
    - Storage devices are attached (or mounted) at various points on the tree.

Not imposed by the system. Can vary from one system to the other, even between two GNU/Linux installations!

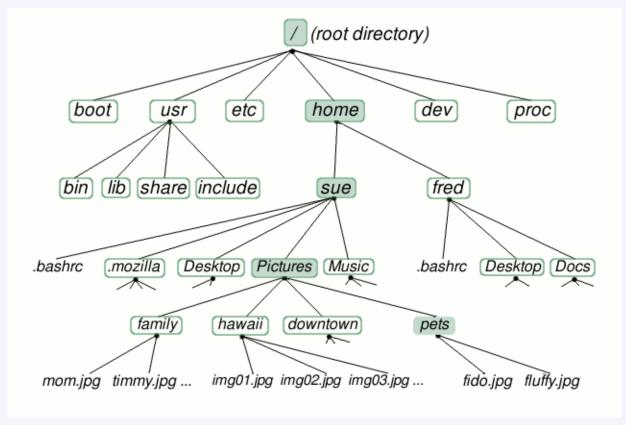

```
/ Root directory
/bin/ Basic, essential system commands
/boot/ Kernel images, initrd, configuration files
/dev/ Files representing devices
/etc/ System configuration files
/home/ User directories
/lib/ Basic system shared libraries
/media/ Mount points for removable media
```

```
/lost+found/ Corrupt files the system tried to recover
/mnt/ Mount points for temporarily mounted filesystems
/opt/ Specific tools installed by the sysadmin
/usr/local/ often used instead
/proc/ Access to system information
/sbin/ Administrator-only commands
/sys/ System and device controls
/tmp/ Temporary files
```

The Unix filesystem structure is defined by the Filesystem Hierarchy Standard (FHS): <a href="http://www.pathname.com/fhs/pub/fhs-2.3.html">http://www.pathname.com/fhs/pub/fhs-2.3.html</a>

http://en.wikipedia.org/wiki/Filesystem\_Hierarchy\_Standard

## Linux File System-home directory

Lists the files in the current directory, in alphanumeric order, except files starting with the "." character.

- \$ ls -a (all)
  Lists all the files (including .\* files)
- \$ ls -1 (long)
  Long listing (type, date, size, owner, permissions)
- \$ ls -t (time)
  Lists the most recent files first
- \$ ls -S (size)
  Lists the biggest files first
- \$ ls -r (reverse)
  Reverses the sort order
- \$ ls -ltr (options can be combined)
  Long listing, most recent files at the end

- \$ ls \*txt
  The shell first replaces \*txt by all the file and directory names ending by txt (including .txt),
  except those starting with ., and then executes the ls command line.
- \$ ls -d .\*
   Lists all the files and directories starting with .
   -d tells ls not to display the contents of directories.
   \$ ls -d \*/
- \$ ls ?.log
  Lists all the files which names start by 1 character and end by .log
- http://www.thegeekstuff.com/2009/07/linux-ls-command-examples/

- In Linux, file is defined as simply the thing that deals with a sequence of bytes
- Hence everything are files: an ordinary file is a file; a directory is also file; a network card, a hard disk, any device are also files since they deal with a sequence of bytes

#### Moving around

#### • Symbolic (soft) link

- Not a real file, just a link to another file
- Allows giving another name to a file without actually duplicating it hence saves memory space

#### Special file (device)

- Each hardware device, e.g. keyboard, hard disk, CD-ROM, etc. is associated with at least one file
- Usually store in /dev directory
- Applications can read and write any devices by reading and writing their associate file hence the access method is known as device independent
- Divide into two types: character special files, e.g. keyboard, and block special files, e.g. disk

```
dlun@enpklun.polyu.edu.hk: /home/dlun/Desktop

                                         144 May 17
[dlun@enpklun Desktop]$ [
                                                      Names in blue are
                                                      directories, indicated by a
                                                      letter d at the beginning
      A symbolic link begins with a letter I
                                                      of the line
```

## Moving around

- Display the current/working directory
  - \$ pwd
  - Print Working Directory
  - displays your current location within the file system.
- Change (navigate) directories.
  - \$ cd dir name
  - Change Directories
  - changes the position to the specific directory
- You can specify directory names in two ways:
  - Absolute pathname (starts from the root of the tree)

```
$ cd /u/home/hpc/test/bin
```

Relative pathname (relative to your current directory)

```
$ cd
$ cd .
$ cd ..
$ cd test/bin
```

#### Special directories

•

- The current directory.
- Useful for commands taking a directory argument.
- Useful to run commands in the current directory
- ./readme.txt and readme.txt are equivalent.

• ...

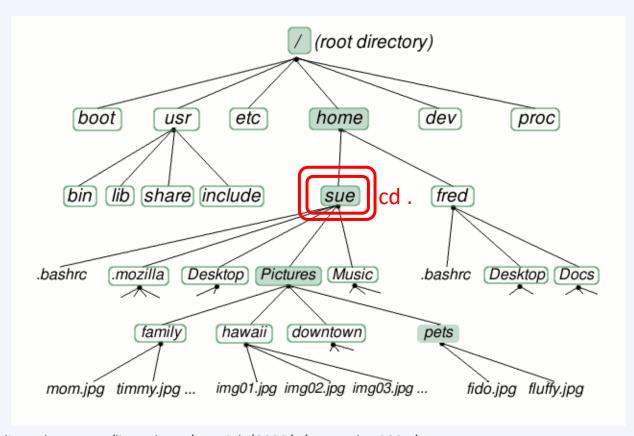

- The parent (enclosing) directory. Always belongs to the . Directory
- Typical usage: cd ..

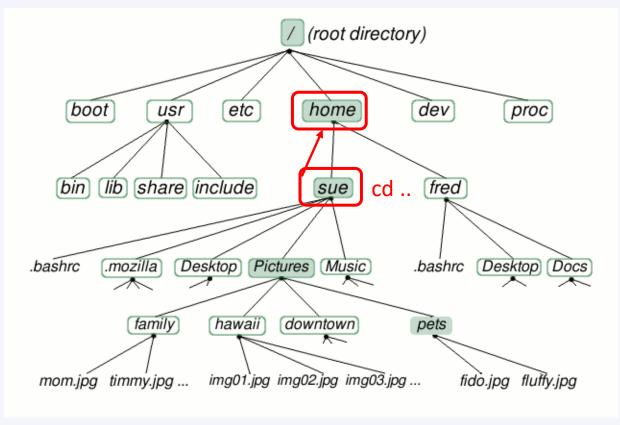

• ~

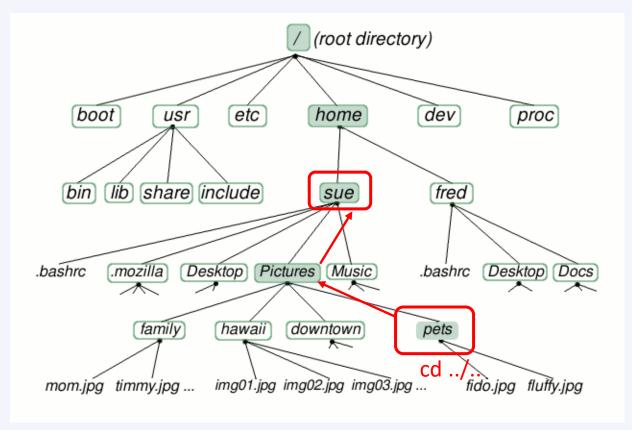

• Shells just substitute it by the home directory of the current user.

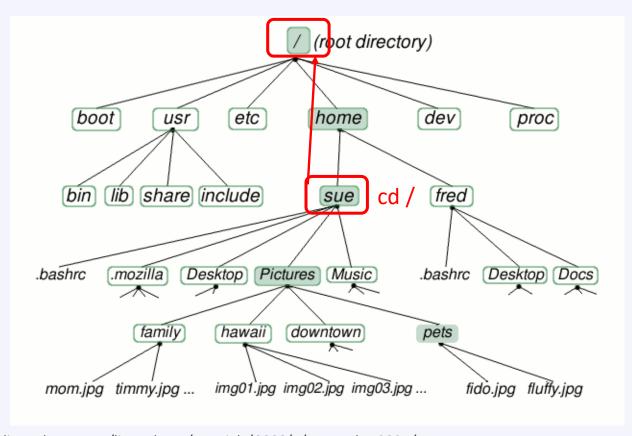

• .

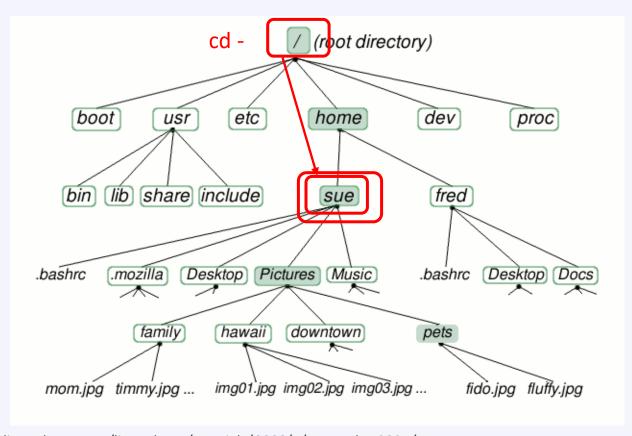

cd – jump back to the previous directory

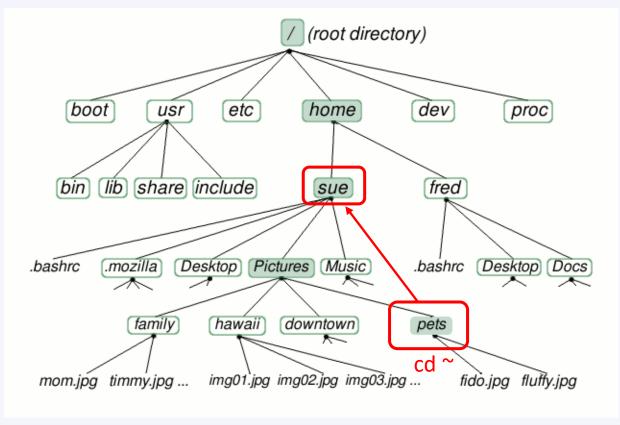

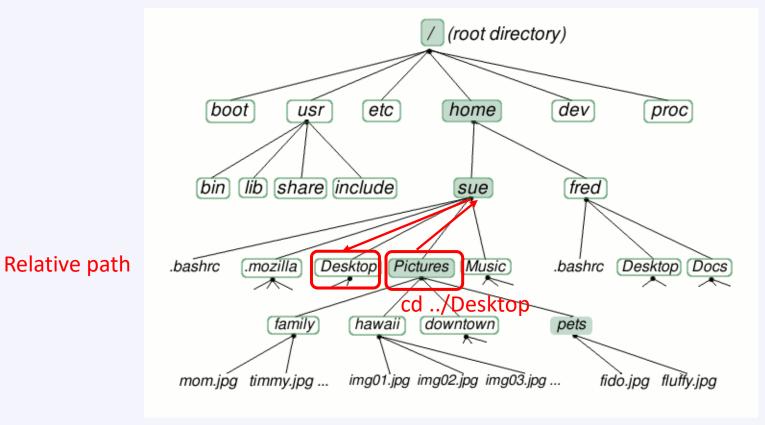

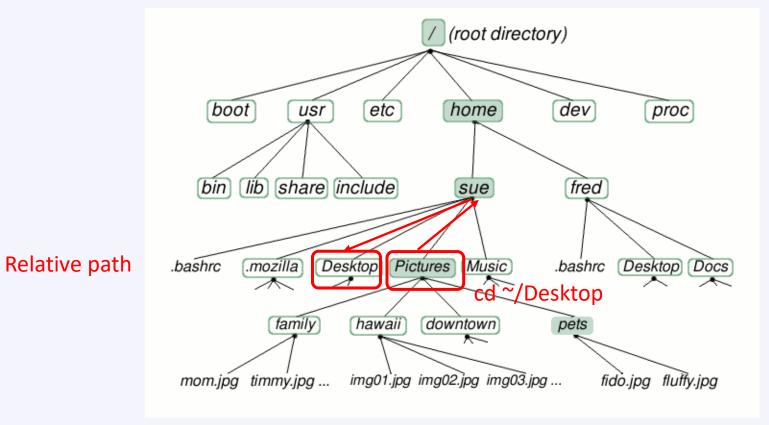

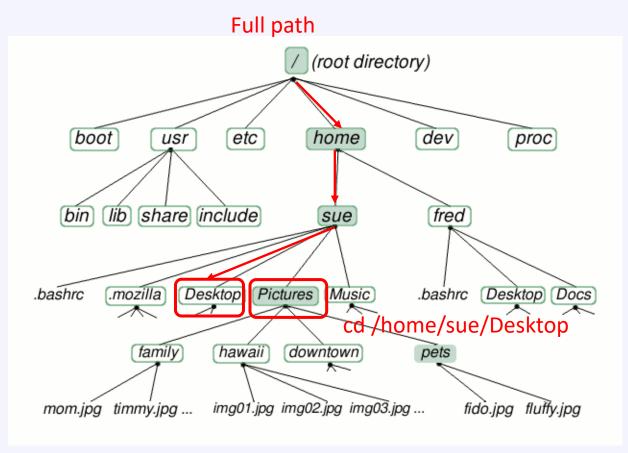

## Linux File System-home directory

#### File paths

- A path is a sequence of nested directories with a file or directory at the end, separated by the / character
- Relative path: documents/fun/file1 Relative to the current directory
- To work with relative paths they need to have connection on the linux tree
- Absolute path: /home/user/leuven/file2
- /: root directory.
   Start of absolute paths for all files on the system
   Not a superuser's home directory (-> /root)

#### More on files

- What does a file contain?
  - Determine a file's type: **file**
  - will print a brief description of the file's contents
  - \$ file filename
- Search for files and directories
  - The **find** command performs a raw search on a file system to locate the specified items.
  - \$ find location -name some-name (\$ find /home/student -name \*desktop)
  - Be careful: results can sometimes be slow
- Search the locate database for files and directories
  - The **locate** command displays the location of files that match the specified name.
  - Faster than find because it searches a database of indexed filenames.
  - Disadvantage: lacks the ability to search for advanced characteristics such as file owner, size, and modification time.

#### File names

#### File name features:

- Case sensitive
- No obvious length limit (255 characters)
- Can contain any character (including whitespace, except /).
- File name extensions not needed and not interpreted. Just used for user convenience. (File types stored in the file)
- a hidden file is any file that begins with a "." (not seen with the bare Is
- File name examples:

```
README .bashrc index.htm index.html
```

## **Auto-Completion**

- Have the shell automatically complete commands or file paths.
- Activated using the <TAB> key on most systems
- examples
  - •\$ whe<TAB>
  - \$ whereis
  - \$ ls -l /etc/en<TAB>
  - \$ ls -l /etc/environment
- When more than one match is found, the shell will display all matching results (use <TAB> twice)
  - •\$ ls -l /etc/host<TAB>

## Command history: Arrow Up

- Previously executed commands can be recalled by using the **Up Arrow** key on the keyboard.
- Most Linux distributions remember the last five hundred commands by default.
- Display commands that have recently been executed
  - The history command displays a user's command line history.
  - You can execute a previous command using ! [NUM] where NUM is the line number in history you want to recall.

# Globbing: use wildcard

Wildcard	Function	
*	Matches 0 or more characters	
?	Matches 1 character	
[abc]	Matches one of the characters listed	
[a-c]	Matches one character in the range	
[!abc]	Matches any character not listed	
[!a-c]	Matches any character not listed in the range	
{tacos,nachos}	Matches one word in the list	

```
$ ls -l /etc/host*
$ ls -l /etc/hosts.{allow,deny}
$ ls -l /etc/hosts.[!a]*
$ ls -l /etc/host?
```

## Input and Output

- Programs and commands can contain an input and output. These are called 'streams'. UNIX programming is oftentimes stream based.
- STDIN 'standard input,' or input from the keyboard
- SDTOUT 'standard output,' or output to the screen
- STDERR 'standard error,' error output which is sent to the screen.

#### File Redirection

- Often we want to save output (stdout) from a program to a file. This can be done with the 'redirection' operator.
  - myprogram > myfile using the '>' operator we redirect the output from myprogram to file myfile

- Similarly, we can append the output to a file instead of rewriting it with a double '>>'
  - myprogram >> myfile using the '>' operator we append the output from myprogram to file myfile

## Input Redirection

- Input can also be given to a command from a file instead of typing it to the screen, which would be impractical.
  - mycommand < programinput using the '< ' operator we redirect the input from the file programinput to mycommand
  - programinput is printed to stdout, which is redirected to a command mycommand.
  - Not all commands read standard input (ls, date, who, pwd, cd, ps, ...)

## Redirecting stderr

- Performing a normal redirection will not redirect sdterr. In Bash, this can be accomplished with '2>'
  - command 2> file1
- Or, one can merge stderr to stdout (most popular) with '2>&1'
  - command > file 2>&1

## **Pipes**

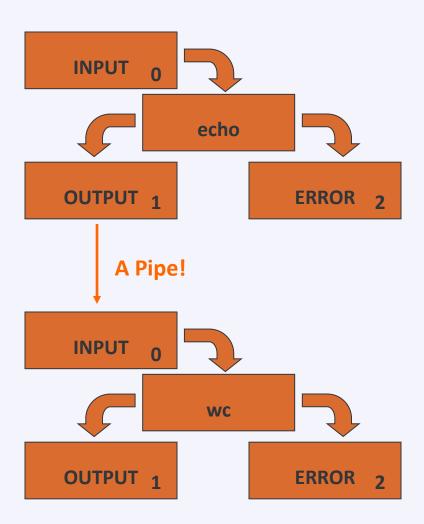

- Using a pipe operator '|' commands can be linked together. The pipe will link the standard output from one command to the standard input of another.
- Very helpful for searching files
- e.g. when we want to list the files, but only the ones that contain test in their name:

```
ls -la|grep test
```

## Pipes

• Lots of Little Tools

```
echo "Hello" | \
wc -c
```

# Difference Between Single, Double, and Backwards Quote

- Single quotes (') do not interpret any variables
- Double quotes (") interpret variables
- Backwards quotes (`) interpret variables and treat them as a program to run and return the results of that program

## Quote characters

There are three different quote characters with different behaviour. These are:

- ": double quote, weak quote. If a string is enclosed in "" the references to variables (i.e \$variable\*) are replaced by their values. Also, back-quote and escape \ characters are treated specially.
- ': single quote, strong quote. Everything inside single quotes are taken literally; nothing is treated as special.
- `: back quote. A string enclosed as such is treated as a command and the shell attempts to execute it. If the execution is successful, the primary output from the command replaces the string.

Example: echo "Today is:" `date`

# File Manipulation

• For all file manipulation commands relative of absolute paths can be used (or just files in the current directory when no extra path specified)

• Most of the commands are intuitive – shortcuts of English names

#### **Directories**

- Create directories
  - The mkdir command is used to create directories
  - •\$ mkdir dir1 dir2 dir3
- Remove directories
  - The rmdir command removes directories
  - •\$ rmdir dir1
  - rmdir will only remove empty directories.
    To remove a non-empty directory, use

```
$ rm -r [DIRECTORY] instead.
```

## Copy a file

- The cp command copies files and directories
- The default behavior will overwrite any existing file(s). The -i option overrides this behavior and prompts the user before overwriting the destination file.
- syntax: cp [OPTIONS] [SOURCE] [DESTINATION]
  - -\$ cp <source\_file> <target\_file>
    Copies the source file to the target.
  - -\$ cp file1 file2 file3 ... dir Copies the files to the target directory (last argument).
  - −\$ cp -i (interactive)Asks for user confirmation if the target file already exists
  - -\$ cp -r <source\_dir> <target\_dir> (recursive)
    Copies the whole directory.
  - -\$ cp -v (verbose)Displays what has been copied

#### Move or rename files

- Move or rename files and directories: my
- The default behavior will overwrite any existing file(s).
- syntax: mv [OPTIONS] [SOURCE] [DESTINATION]
  - \$ mv old\_name new\_name Renames the given file or directory.
  - \$ m∨ -i (interactive)

    If the new file already exits, asks for user confirm
- The my command can also be used to move or rename directories
  - \$ mv NewFiles/ OldFiles/
  - -r option is not necessary

#### Remove files

- The rm command removes files.
- \$ rm file1 file2 file3 ... Removes the given files.
- \$ rm -i (interactive)
  Always ask for user confirmation.
- \$ rm -r dir1 dir2 dir3 (recursive)
  Removes the given directories with all their contents.

#### • Tip:

Whenever you use wildcards with rm (besides carefully checking your typing!), test the wildcard first with ls. This will let you see the files that will be deleted. Then press the up arrow key to recall the command and replace the ls with rm.

#### Create links

- Create links (shortcuts) to files or directories: ln
- Symbolic links are created when using the -s option with the ln command.
- Allows to jump to other files or locations on the file system
- Editing a symbolic link file is the same as editing the source file, but deleting the symbolic link does not delete the source file.
  - \$ ln -s file v5.doc file final.doc
  - creates a symbolic link called file\_final.doc that points to file\_v5.doc
  - \$ ln -s /home/demo/dir1/dir2/dir3 /home/demo/jump2dir
  - creates a symbolic link called jump2dir that points to a deep directory allows for quicker access)

#### Text editors

- Text-only text editors
  - Often needed for sysadmins and great for power users
  - vi, vim
  - nano
- Graphical text editors
  - Fine for most needs
  - Gedit,
  - Kate, Nedit
  - Emacs, Xemacs
- <a href="http://www.thegeekstuff.com/2009/07/top-5-best-linux-text-editors/">http://www.thegeekstuff.com/2009/07/top-5-best-linux-text-editors/</a>

### Text editors

#### How to start:

- Create a file
  - \$ touch filename (creates an empty file)
  - start editing (non)-existing file:
    - \$ vi filename
    - \$ nano filename
    - \$ gedit filename

#### vi

- Text-mode text editor available in all Linux systems.
- Created before computers with mice appeared.
- Difficult to learn for beginners used to graphical text editors.
- Very productive for power users.
- Check the web for tutorials:
  - <a href="https://upload.wikimedia.org/wikipedia/commons/d/d2/Learning\_the\_vi\_Editor.pdf">https://upload.wikimedia.org/wikipedia/commons/d/d2/Learning\_the\_vi\_Editor.pdf</a>
  - <a href="ftp://ftp.vim.org/pub/vim/doc/book/vimbook-OPL.pdf">ftp://ftp.vim.org/pub/vim/doc/book/vimbook-OPL.pdf</a>

#### vi

- 2 basic modes of operation:
  - command mode and editing mode.
  - Within Command Mode, signals from the terminal are interpreted as editing commands.
  - Editing mode: letters typed at the keyboard are inserted into the editing buffer.
- Pressing **Esc** on the keyboard activates command mode.

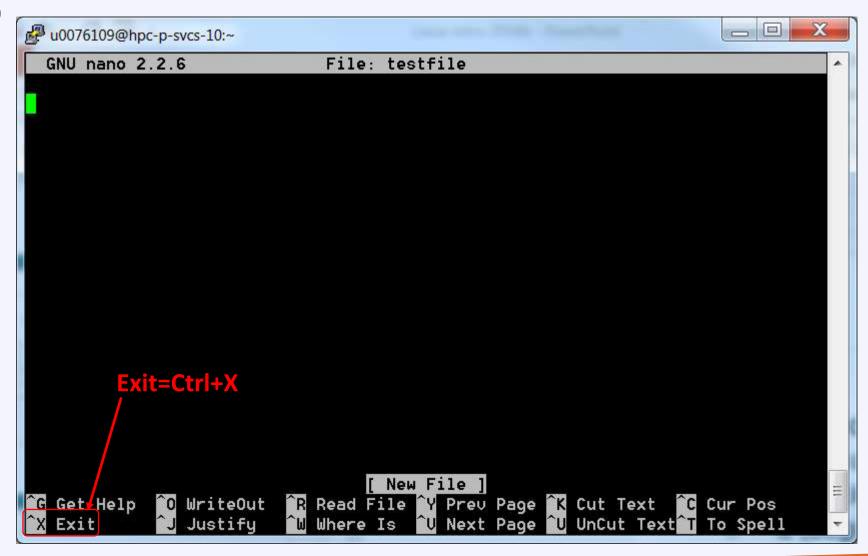

Key(s)	Function	Key(s)	Function
:w	Save	А	Append text after
:х	Save and exit	r	Replace text before cursor
:q	Quit	R	Replace text after cursor
1	Insert text after	i	Insert text before
Р	Paste copied text	уу	Copy current line
а	Append text before	/[TEXT]	Search for the specified text

#### Vi

- 2 modes
  - Input mode
    - ESC to back to cmd mode
  - Command mode
    - Cursor movement
      - h (left), j (down), k (up), l (right)
      - ^f (page down)
      - ^b (page up)
      - ^ (first char.)
      - \$ (last char.)
      - G (bottom page)
      - :1 (goto first line)
    - Switch to input mode
      - a (append)
      - i (insert)
      - o (insert line after
      - O (insert line before)

- Delete
  - dd (delete a line)
  - d10d (delete 10 lines)
  - d\$ (delete till end of line)
  - dG (delete till end of file)
  - x (current char.)
- Paste
  - p (paste after)
  - P (paste before)
- Undo
  - u
- Search
  - /
- Save/Quit
  - :w (write)
  - :q (quit)
  - :wq (write and quit)
  - :q! (give up changes)

## Nano

## Displaying file contents

Several ways of displaying the contents of files.

- \$ cat file1 displays the contents of the given file.
- \$ cat file1 file2 file3 ... (concatenate)
  Concatenates and outputs the contents of the given files.
- \$ more file1
   Display the output of a command or text file one page at a time.
- Can also jump to the first occurrence of a keyword (/ command).

## Displaying file contents

- \$ less file1
   Does more than more.
   Doesn't read the whole file before starting.
   Supports backward movement in the file (? command).
   Press q to exit
- \$ display file1

  Displays graphical file (simple image)

#### The head and tail commands

- \$ head [-<n>] <file>
   Displays the first <n> lines (or 10 by default) of the given file.
   Doesn't have to open the whole file to do this!
- \$ tail [-<n>] <file>
   Displays the last <n> lines (or 10 by default) of the given file.
   No need to load the whole file in RAM! Very useful for huge files.
- \$ tail -f <file> (follow)

  Displays the last 10 lines of the given file and continues to display new lines when they are appended to the file.

Very useful to follow the changes in a log file, for example.

## The grep command

- \$ grep <pattern> <files> Scans the given files and displays the lines which match the given pattern.
- \$ grep error \*.log
  Displays all the lines containing error in the \*.log files
- \$ grep -i error \*.log Same, but case insensitive
- \$ grep -ri error . Same, but recursively in all the files in the current directory and its subdirectories
- \$ grep -v info \*.log
  Outputs all the lines in the files except those containing info.
- http://www.thegeekstuff.com/2009/03/15-practical-unix-grep-command-examples/

## wget

- Instead of downloading files from your browser, just copy and paste their URL and download them with wget
- main features
  - http and ftp support
  - Can resume interrupted downloads
  - Can download entire sites or at least check for bad links
  - Very useful in scripts or when no graphics are available (system administration, embedded systems)
- •\$ wget -c http://microsoft.com/customers/dogs/winxp4dogs.zip Continues an interrupted download.
- •\$ wget -r -np http://www.xml.com/ldd/chapter/book/ Recursively downloads an on-line book for off-line access. -np: "no-parent". Only follows links in the current directory.

## Measuring disk usage

• \$ du -h <file>

-h: returns size on disk of the given file, in human readable format: K (kilobytes), M (megabytes) or G (gigabytes),

Without -h, du returns the raw number of disk blocks used by the file (hard to read).

Note that the -h option only exists in GNU du.

• \$ du -sh <dir>

-s: returns the sum of disk usage of all the files in the given directory.

## File Archiving: tar

- Saves and restores multiple files to/from a single file. Directories followed recursively.
- Format:
  - •\$ tar [options] [options values] [files]
  - c create a new archive
  - v verbosely list files which are processed.
  - f following is the archive file name
  - z filter the archive through gzip (compress)
  - x extract files from archive
  - j filter the archive through bzip (compress)

## File Archiving: tar

• Examples:

```
    $ tar -cvf [FILE] [ITEM] Backup the specified item(s)
    $ tar -cvf /tmp/backup.tar ~/data ~/test
    $ tar -czvf [FILE] [ITEM] Compress the archive to save space
    $ tar -xvf [FILE] [ITEM] Restore the specified item(s) $tar -xvf backup.tar
```

- \$ tar -tf [FILE] List all files in the specified archive e.g. \$ tar -tf backup.tar
- http://www.thegeekstuff.com/2010/04/unix-tar-command-examples/

## File Compression: gzip

- Compressing files: gzip filename or bzip2 filename
  - •\$ gzip backup.tar
  - •\$ bzip2 backup.tar

The resulted file is backup.tar.gz/ backup.tar.bz2

- Uncompressing files: gzip -d filename.gz or bzip2 -d filename.bz2
  - •\$ gzip -d backup.tar.gz
  - •\$ bzip2 -d backup.tar.bz2

The uncompressed file is backup.tar

# File access rights

#### Linux File Access Privilege

- Linux is a multiuser system, the files of all users are stored in a single file structure
- Mechanism is required to restrict one user to access the files of another user, if he is not supposed to
- User can impose access permission to each file to restrict its access
- The term "access permission" refers to
  - read permission
  - write permission
  - execute permission

## File access rights

#### 3 types of access rights

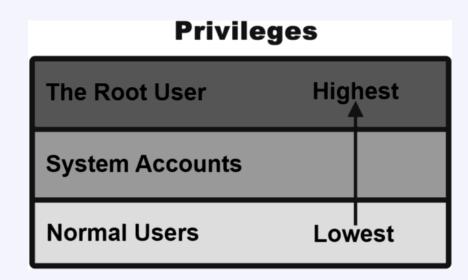

- Read access (r)
  - reading, opening, viewing, and copying the file is allowed
- Write access (w)
  - writing, changing, deleting, and saving the file is allowed
- Execute rights (x)
  - executing and invoking the file is allowed. This is required for directories to allow searching and access.

Use 1s −1 to check file access rights

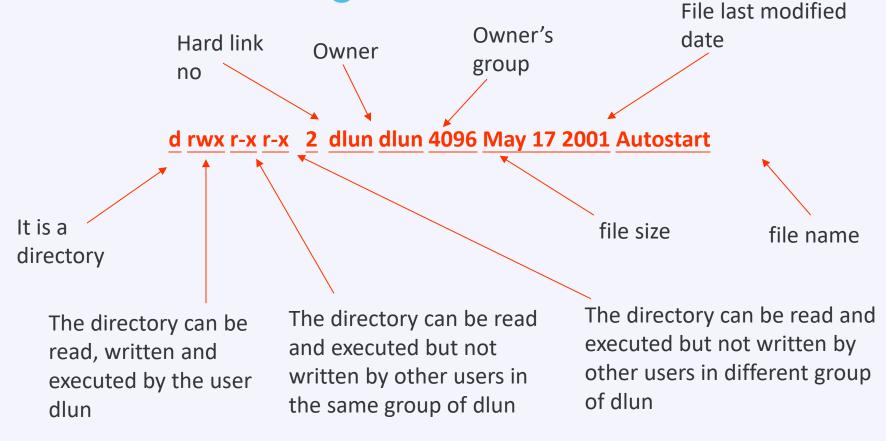

## File access rights

#### 3 types of access levels

- User (u): for the owner of the file
- Group (g): each file also has a "group" attribute, corresponding to a given list of users
- Others (o): for all other users

# File access rights

The group of a user is assigned by the administrator when a user is added to the system

# File access rights

- Access permission can also be assigned to a directory
- Directory is also a file that contains the attributes of the files inside it
- If read permission is not given to a directory
  - cannot show the structure of this directory
  - e.g. cannot use Is
- If write permission is not given to a directory
  - cannot modify anything of the directory structure
  - e.g. cannot copy a file into this directory since it will modify the directory structure by adding one more file
- If execute permission is not given to a directory
  - nearly nothing can be done with this directory, even cd

### Access rights examples

- -rw-r--r--Readable and writable for file owner, only readable for others
- -rw-r----Readable and writable for file owner, only readable for users belonging to the file group.
- drwx---- Directory only accessible by its owner
- -----r-x
  File executable by others but neither by your friends nor by yourself. Nice protections for a trap...

# Access rights examples

                                                    7 16:05 test1.txt
[dlun@enpklun test]$ cd temp
[dlun@enpklun temp]$ |
                                now we can change the directory to temp
                                                                                 UPERCOMPUTER
```

VLAAMS

CENTRUM

### chmod: changing permissions

- Permissions allow you to share files or directories or to lock them down to be private.
- \$ chmod (change mode)
- •\$ chmod <permissions> <files>
  - 2 formats for permissions:
    - octal format (3 digit octal form)
    - symbolic format

## chmod: changing permissions

```
octal format (abc):
 a,b,c = r*4+w*2+x*1 (r, w, x: booleans)
      • 0 none

    1 execute-only

                                --X
      • 2 write
                                -W-
      • 3 execute and write
                                -WX

    4 read-only

      • 5 read and execute
                                r-x

    6 read and write

                                      rw-
      • 7 read, write, and execute
                                      rwx
```

• \$ chmod 644 <file> (rw for u, r for g and o)

660: 110 110 000  $\Rightarrow$  rw- rw- --
545: 101 100 101  $\Rightarrow$  r-x r-- r-x

## chmod: changing permissions

#### • symbolic format:

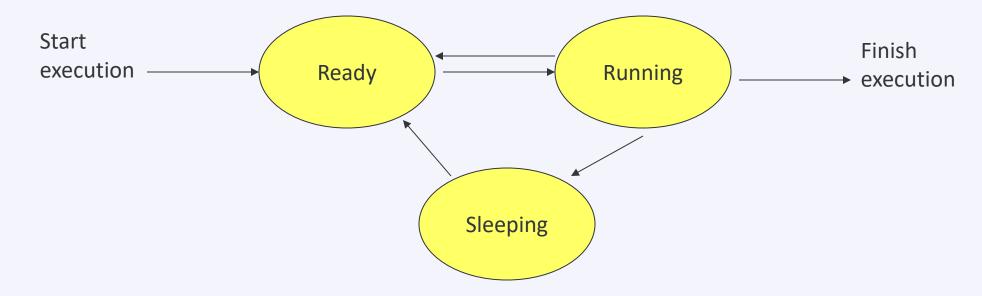

- \$ chmod go+r: add read permissions to group and others.
- \$ chmod u-w: remove write permissions from user.
- \$ chmod a-x: (a: all) remove execute permission from all.

### Access right constraints

- x is sufficient to execute binaries Both x and r and required for shell scripts.
- Both r and x permissions needed in practice for directories: r to list the contents, x to access the contents.
- You can't rename, remove, copy files in a directory if you don't have w access to this directory.
- If you have w access to a directory, you can remove a file even if you don't have write access to this file (remember that a directory is just a file describing a list of files). This even lets you modify (remove + recreate) a file even without w access to it.

- "Everything in Unix is a file. Everything in Unix that is not a file is a process"
- Processes
  - Instances of a running programs
  - Several instances of the same program can run at the same time
  - Processes are assigned a unique identifier which is used to monitor and control the process (PID)

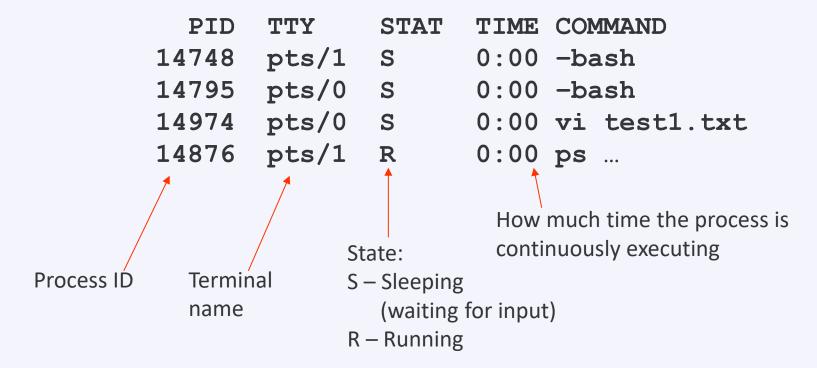

- A program that is claimed to be executing is called a process
- For a multitasking system, a process has at least the following three states:

- Ready state
  - All processes that are ready to execute but without the CPU are at the ready state
  - If there is only 1 CPU in the system, all processes except one are at the ready state
- Running state
  - The process that actually possesses the CPU is at the running state
  - If there is only 1 CPU in the system, at most there is only one process is at the running state
- Sleeping state
  - The process that is waiting for other resources, e.g. I/O, is at the sleeping state

#### ps

- Display running processes (cfr. Windows Task Manager ctrl-shift-esc)
- \$ ps Display the current user's processes
- \$ ps -e Display all processes running on the system
- \$ ps -ef Display detailed information about running processes
- \$ ps -u [USER] Display processes owned by the specified user
- \$ ps a Display extra info (running state)

- For the example above, both bash processes, which are the shell of both terminals, are waiting for the input of user. They must be in the sleeping state
- The vi process, which is an editor, is also waiting for the input of user. Hence it is also in sleeping state
- When ps reporting the processes in the system, it is the only process that is running. Hence it is in running state

#### kill

- Sends an abort signal to the given processes. Lets processes save data and exit by themselves. Should be used first.
- \$ kill <pid>
  Example:
  \$ kill 3039 3134 3190 3416
- \$ kill -9 <pid>
  Sends an immediate termination signal. The system itself terminates the processes. Useful when a process is really stuck.

#### &

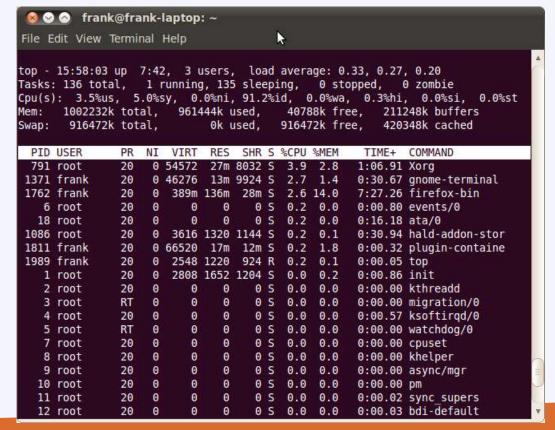

- & is a command line operator that instructs the shell to start the specified program in the background.
- This allows you to have more than one program running at the same time without having to start multiple terminal sessions.
- Starting a process in background: add & at the end of your line:

```
$ gedit &
check with ps
```

#### top

• Displays most important processes, sorted by cpu percentage (use > or < to change the order)

http://www.thegeekstuff.com/2010/01/15-practical-unix-linux-top-command-examples/

#### List of basic commands

Managing files and directories:

```
cp, mv, rm, mkdir, rmdir, touch
```

Displaying content of files

```
cat, more, less, head, tail
```

Moving around

```
pwd, cd, ls
```

Asking for help

```
help, man, info, whatis
```

- + understanding of Linux directory tree (relative and absolute paths)
- + understanding of file permissions

## Tier-2 credit system - what

- What is a credit
  - Credits are a measure for compute time

Cluster / Partition	Credits/h
Genius Skylake / Cascadelake / AMD	10 000
Genius Skylake BigMem	12 000
Genius Skylake 4 GPUs	20 000
Genius Cascadelake 8 GPUs	39 900
Genius Superdome	126 000
wICE Icelake thin node	11 000
wICE Icelake Large Memory	19 000
wICE IceLake GPU node	45 000
wICE interactive node	/

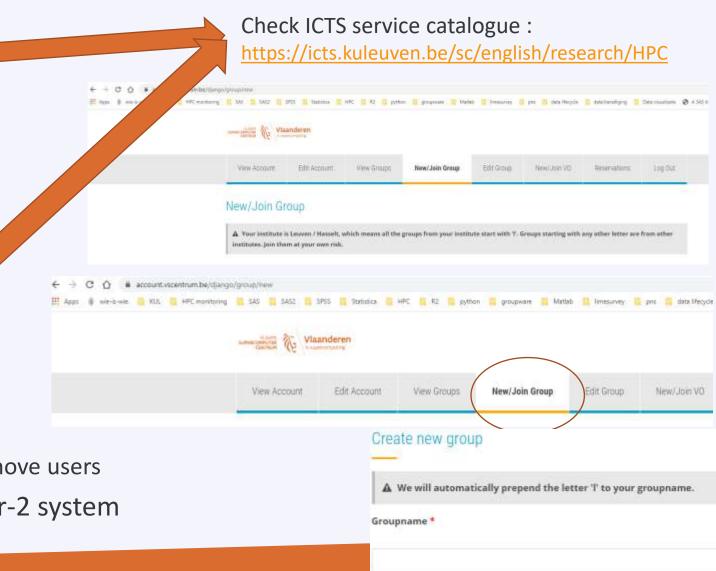

Check ICTS service catalogue:

https://icts.kuleuven.be/sc/english/research/HPC

• Shared nodes are charged based on used fraction

### Tier-2 credit system – how to get credits

- Request your introduction credits
  - Everybody
  - Free of charge
  - 1 time
  - 6 months
- Request permission to join a group
- Request project credits
  - Create group on the accountpage
  - Start the name preferably with p\_
  - Your group will be lp\_
  - Who creates the group can add or remove users
- Tier-2 credits are shared over all Tier-2 system

### Tier-2 credit system - how

- Submit your jobs with reference to the correct project
  - #SBATCH –A lp\_myproject
  - sbatch ... -A lp\_myproject
- Before submitting the job, the amount of available credits is checked with the maximum requested credits for the job
  - Maximum charge for the submitted jobs is calculated
    - Credits = minutes \* floor(#cpu cores\*billing\_weight\_CPU + #gres\*billing\_weight\_gres)
  - Taking into account any running jobs
  - When the job finishes, the actual cost is charged

Command	Purpose
sam-balance [-A account]	List active projects and available credits

## File transfer

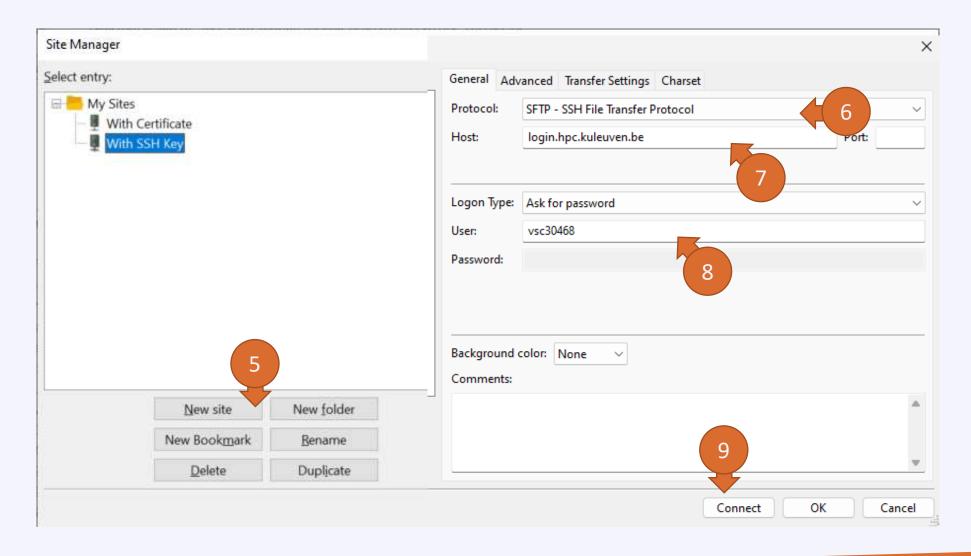

Application	OS
<u>FileZilla</u>	Windows, Linux, Mac
WinSCP	Windows
rsync, scp	Linux, Mac
Globus	Window, Linux, Mac

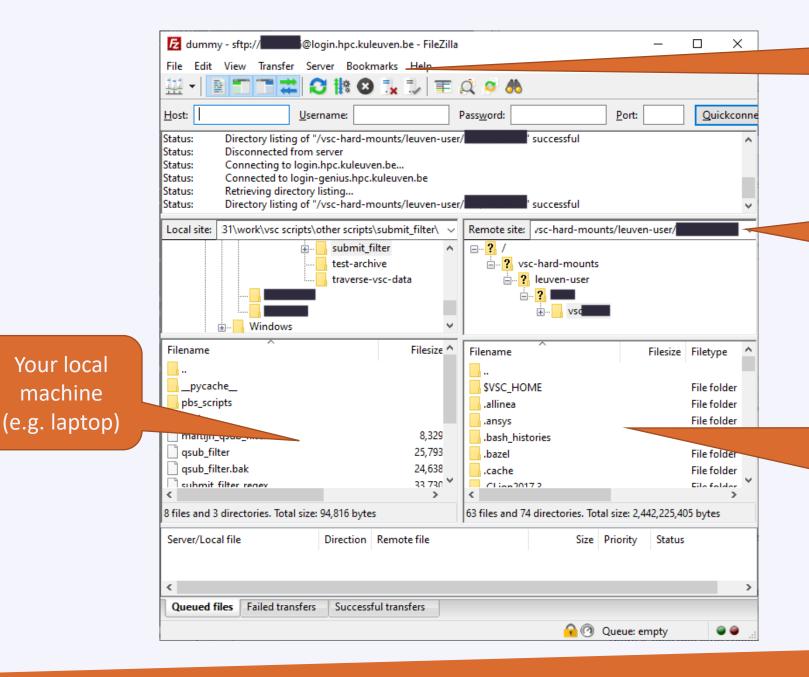

#### File transfer

#### File transfer

For convenience, you'd better bookmark your data and scratch folders!

Instead, go to your \$VSC\_DATA folder, e.g. /data/leuven/399/vsc39934

Your VSC storage (e.g. \$VSC\_DATA, \$VSC\_SCRATCH).

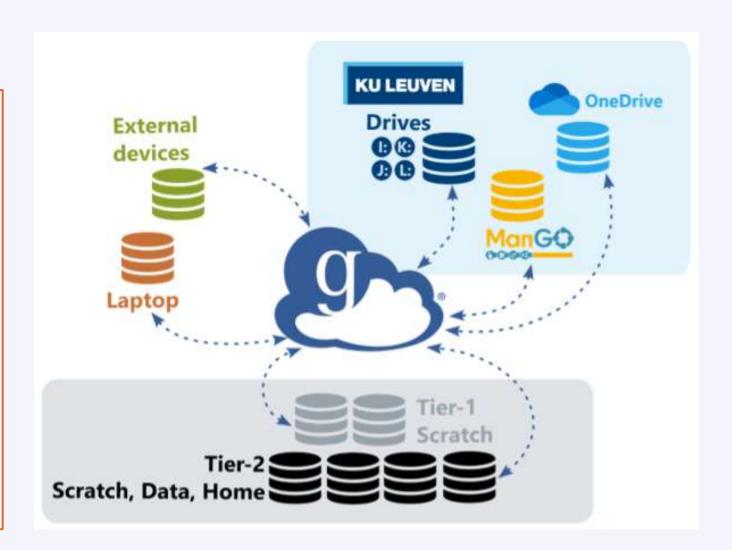

Note: by default you arrive at your own \$VSC\_HOME. Copy nothing there!

#### Globus

- ☐ Transfer, share and search within data
- ☐ Schedule and resume (large) transfers
- ☐ Fully supported by all VSC sites (available on Tier-2 and Tier-1)
- Web-interface
- Workflow:
   Define "endpoint" on the source
   Define "endpoint" on the destination
   Transfer between endpoints
- Existing endpoints:
  Tier-2: home/data/scra

Tier-2: home/data/scratch storages

Tier-1: data/scratch

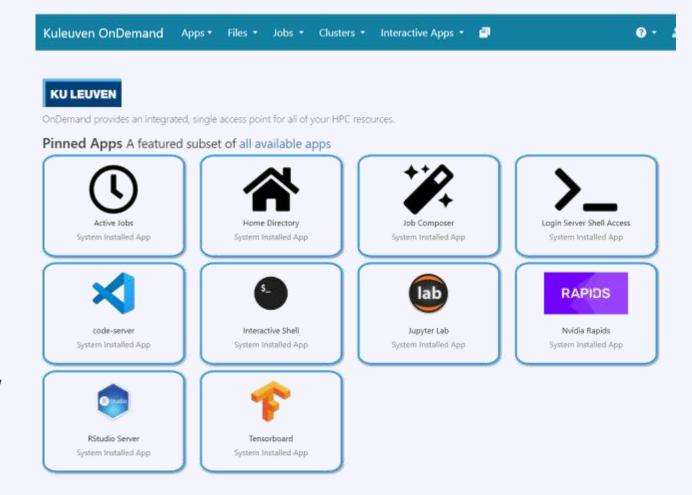

# Open OnDemand

- Access clusters via web browser
- https://ondemand.hpc.kuleuven.be
- Login via KULeuven MFA
- File browser
- Interactive apps + integrated shell
- Create, start and monitor jobs
- Develop, compile and test your code
- VSCode editor
- JupyterLab, Rstudio, MATLAB, ParaView and Tensorboard

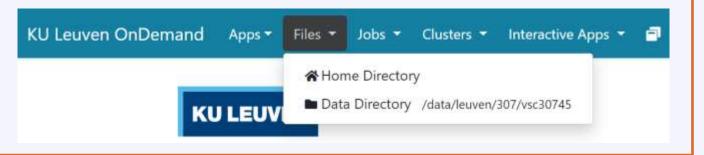

Please close your interactive sessions, when you don't actively use it!

#### Access your VSC storage

- Use "Files" menu to access your VSC\_HOME and VSC\_DATA
- VSC\_SCRATCH is not available

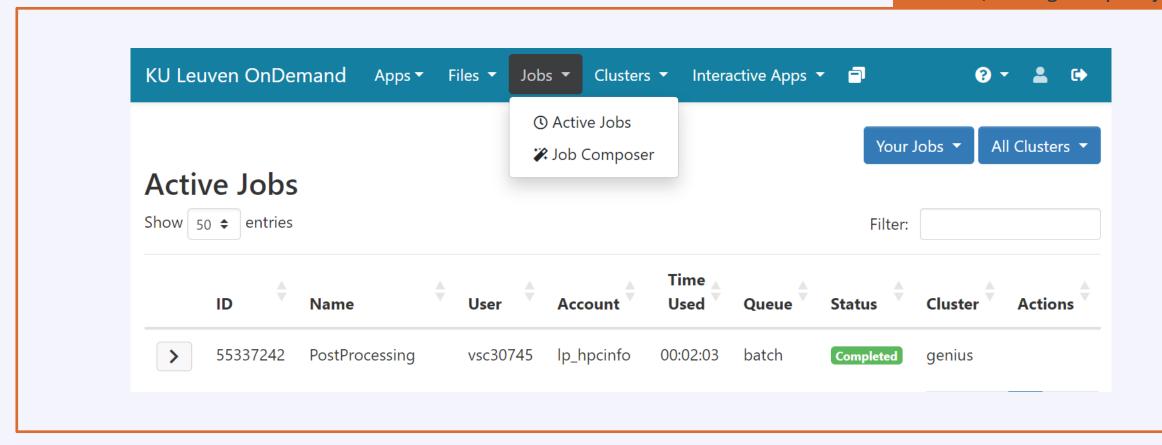

#### File/Folder Management

- OK to transfer small files/folders
- Open any (sub)folder in terminal (new window)
- Deleted files/folders could be retrieved from (hourly, daily, weekly) snapshots

#### Monitor/manage all your jobs

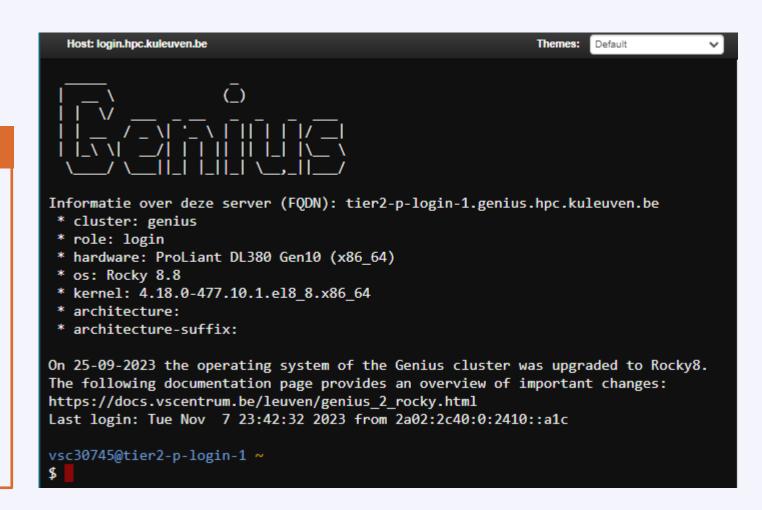

## Open OnDemand: Login Server Shell Access

#### **Login Shell**

- Start shell in a new browser tab
- You land on Genius
   Accessing wICE goes via Genius login
- ✓ You land on your VSC\_HOME
  cd to data/scratch/staging immediately
- Do NOT compute on the login nodes
- Try:
  - \$ sam-balance
  - \$ myquota

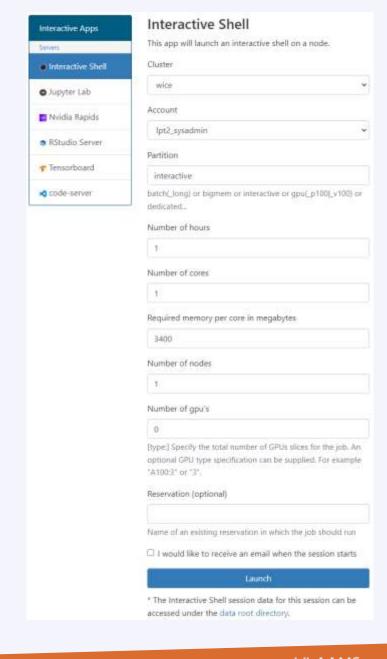

## Open OnDemand: Interactive Shell

#### **Interactive Shell**

- Start shell as a job (on a compute node)
- Recommended to: Install your own software (in VSC\_DATA) Test/run your program interactively Debug a program
- Choose the relevant cluster, partition and resources (core, memory, GPU)

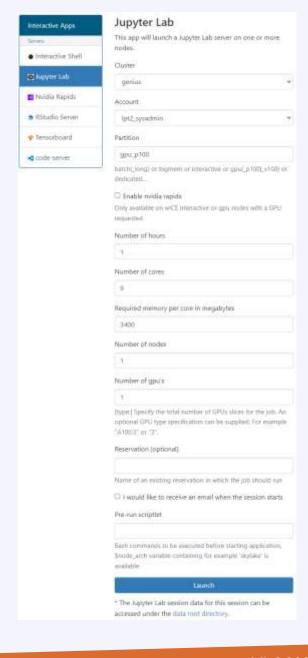

## Open OnDemand: Jupyter Lab

Jupyter Lab

- Create a notebook as a job (on a compute node)
- Best practice to: pre/post-processing your data prototyping add figures and text for pedagogical purposes
- Choose the relevant cluster, partition and resources (core, memory, GPU)
- Extensions are not supported (for now)
- User your own Python/R kernels (next slide)

## Open OnDemand: Custom R/Python Kernels

My Kernels

- Default R/Python kernels are old and limited
- You can create a miniconda env and add it to your OnDemand kernels

Step 1: Miniconda

#### Start an Interactive shell

#### Go to your data folder

\$ cd \${VSC DATA}

#### Download miniconda

\$ wget https://repo.continuum.io/miniconda/Miniconda3-latest-Linux-x86 64.sh

#### Install miniconda into your data folder

\$ bash Miniconda3-latest-Linux-x86\_64.sh -b -p \$VSC\_DATA/miniconda3

#### Permanenly add the path to miniconda to your ~/.bashrc

\$ echo 'export PATH="\${VSC DATA}/miniconda3/bin:\${PATH}" ' >> ~/.bashrc

## Open OnDemand: Custom R/Python Kernels

Step 2: New Environment

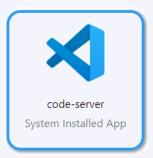

```
Create a new environment <env_name> with all packages you need, e.g. $ conda create --name=<env_name> numpy scipy ... Enable your new environment $ source activate <env_name> Add the ipykernel package $ conda install -c conda-forge ipykernel
```

#### Step 3: Register Your Kernel

```
$ python -m ipykernel install -prefix=~/.local --name <env_name>
Start a new Jupyter Lab session, and the new kernels must be there
```

## Open OnDemand: Other tools

Start Visual Studio Code server as a job.

Develop, deploy and debug your workflow directly on HPC.

Using interactive partition on wICE is free of charge, and is relevant here.

Supports many languages + Github integration.

Start R IDE as a job.

Install your own packages in \$VSC\_DATA.

Track machine learning metrics and visualize data during the workflow. You need to provide a log folder.

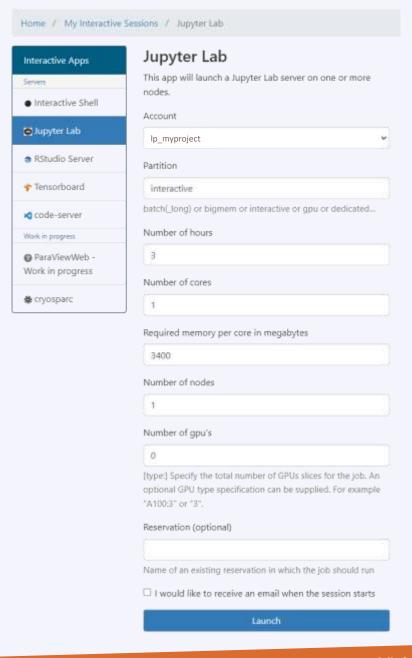

## Open OnDemand: Resources

#### E.g. to start a Jupyter Notebook

- Pick a valid Slurm credit account
- Default partition: batch interactive: Max 8 cores, 1 GPU (shard), 16 hr
- Default resources:
  1 core, 1 hour, 3400MB RAM, no GPU
  (At the reservoirt) year acrost year acrost leaves.

(At the moment) you cannot use scratch and staging

### Software: Available Modules

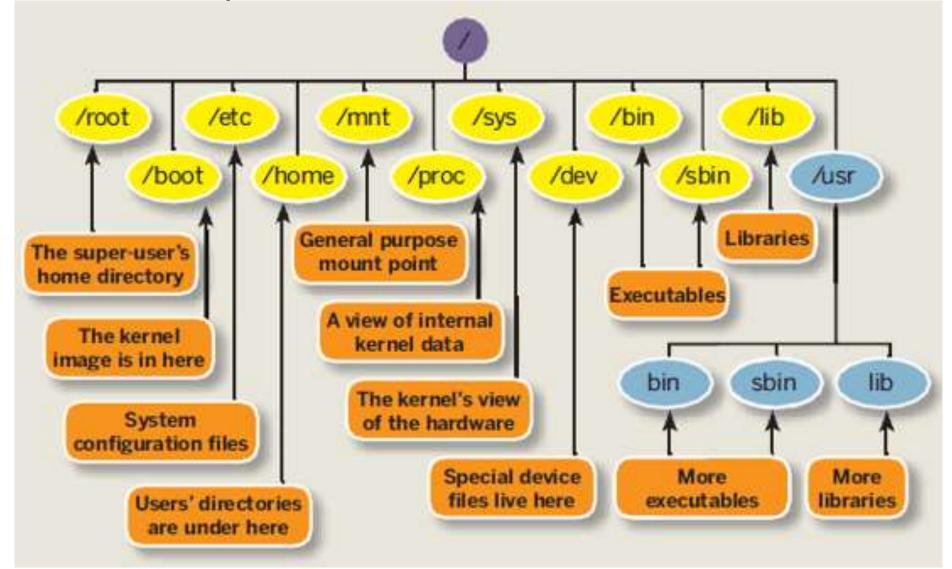

- OS: Rocky Linux 8.x
- Toolchains:
  - Intel (icc, icpc, ifort; Intel MPI; Intel MKL)
  - FOSS (gcc, g++, gfortran; OpenMPI; ScaLAPACK, OpenBLAS, FFTW)
  - Toolchain year on Genius from 2018a; on wICE from 2021a
- Note: Never mix FOSS and Intel compilers (gives dependency conflict)

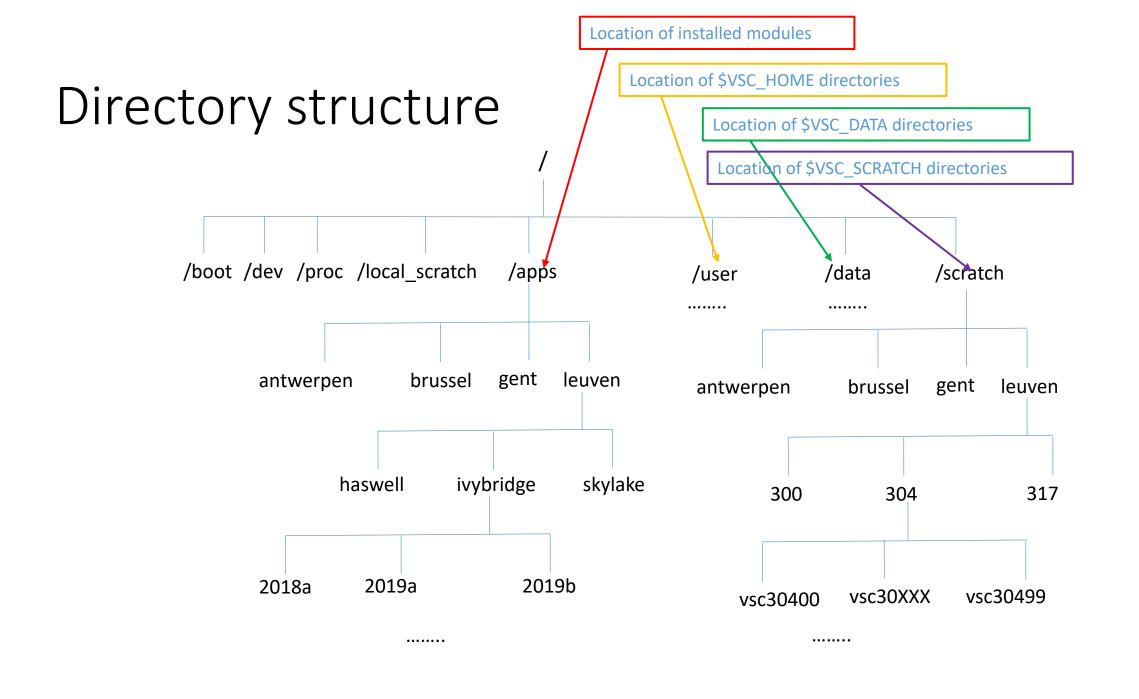

Command	Remark
module av	List all available modules
module av Python	List all Python-related modules
module spider Python	Get more info
module load Python/3.6.4-intel-2018a	Load a specific module
module list	List all loaded modules and their dependencies
module unload Python/3.6.4-intel-2018a	Unload a module (but dependencies still stay)
module purge	Remove all modules from your work session

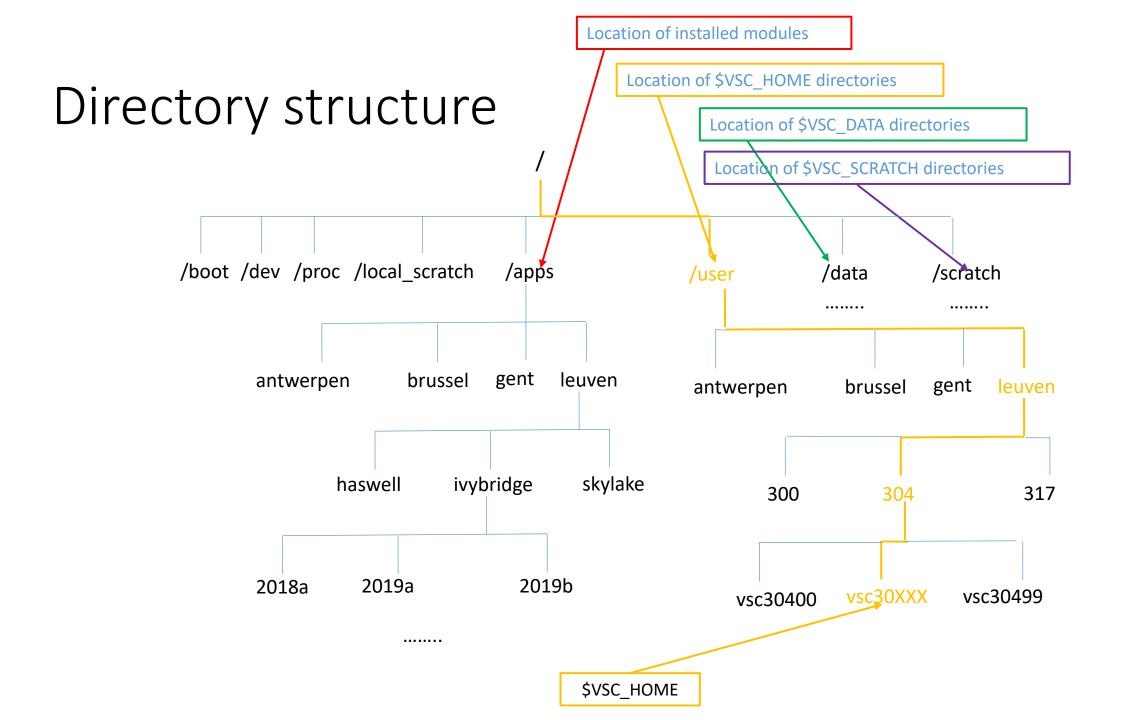

## Software: Your Specific Needs

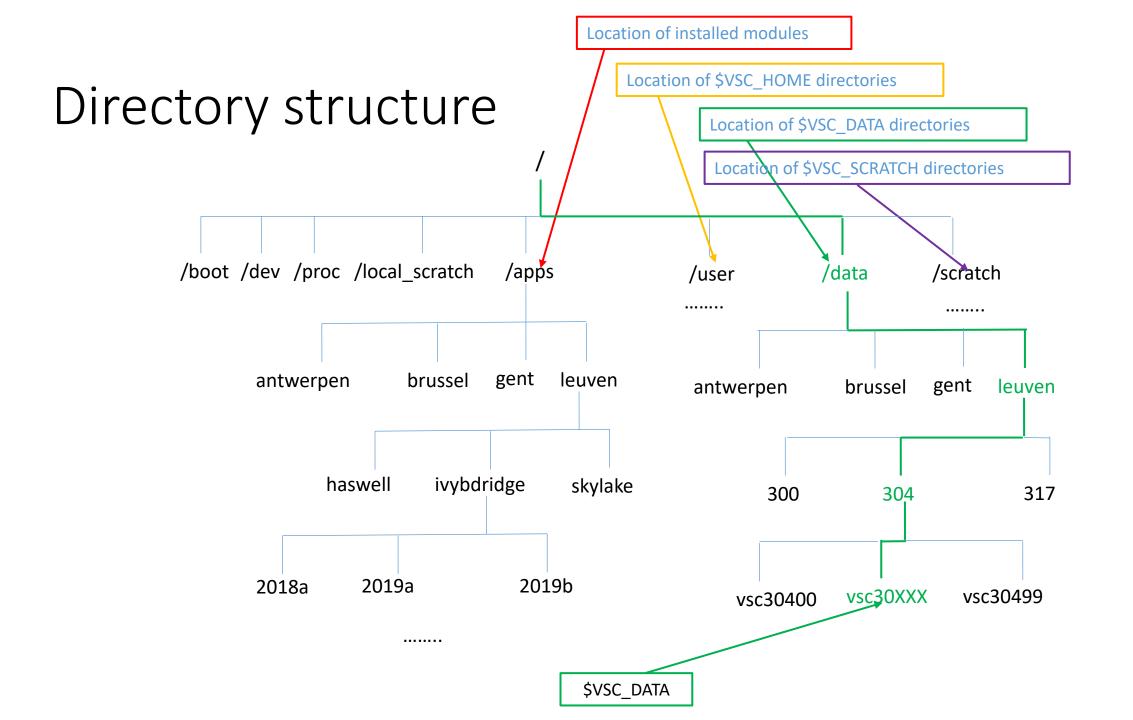

- You can always install your desired software in your \$VSC\_DATA Use Intel or FOSS toolchains
- Compile your code on a compute node (with interactive job)
- If you cannot, ask us for help
- Specific Python/R packages is managed by users via conda
- Read more about <u>Python Package Management</u>
- Read more about <u>R Package Management</u>

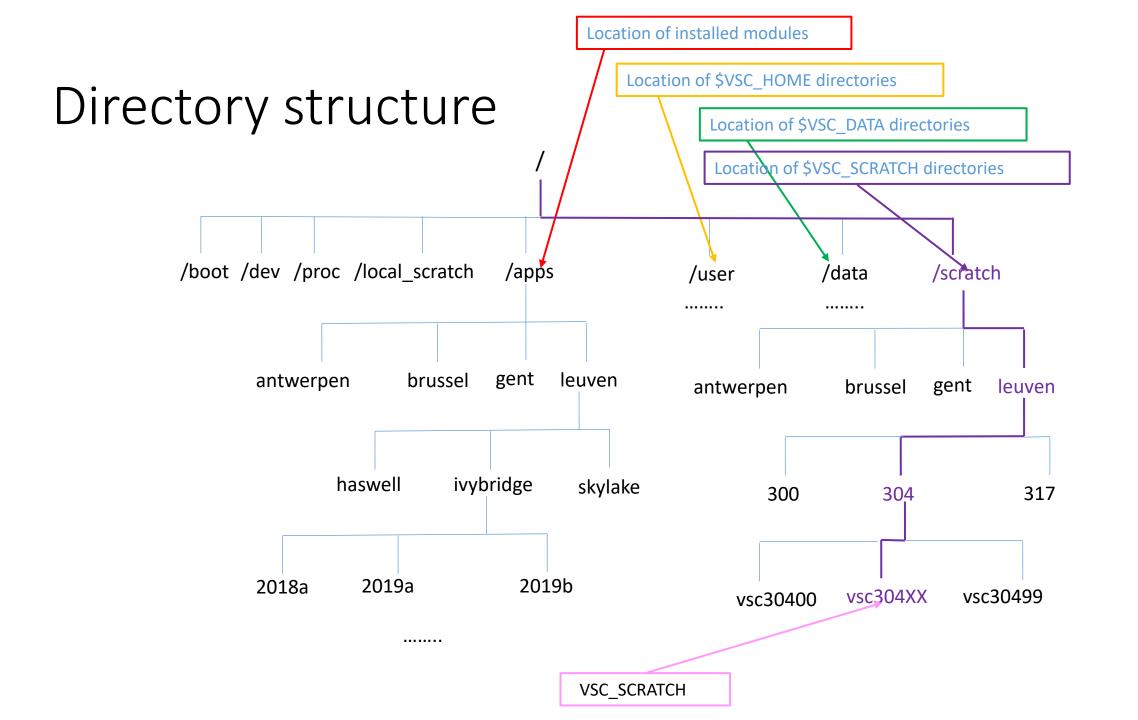

# Linux File System

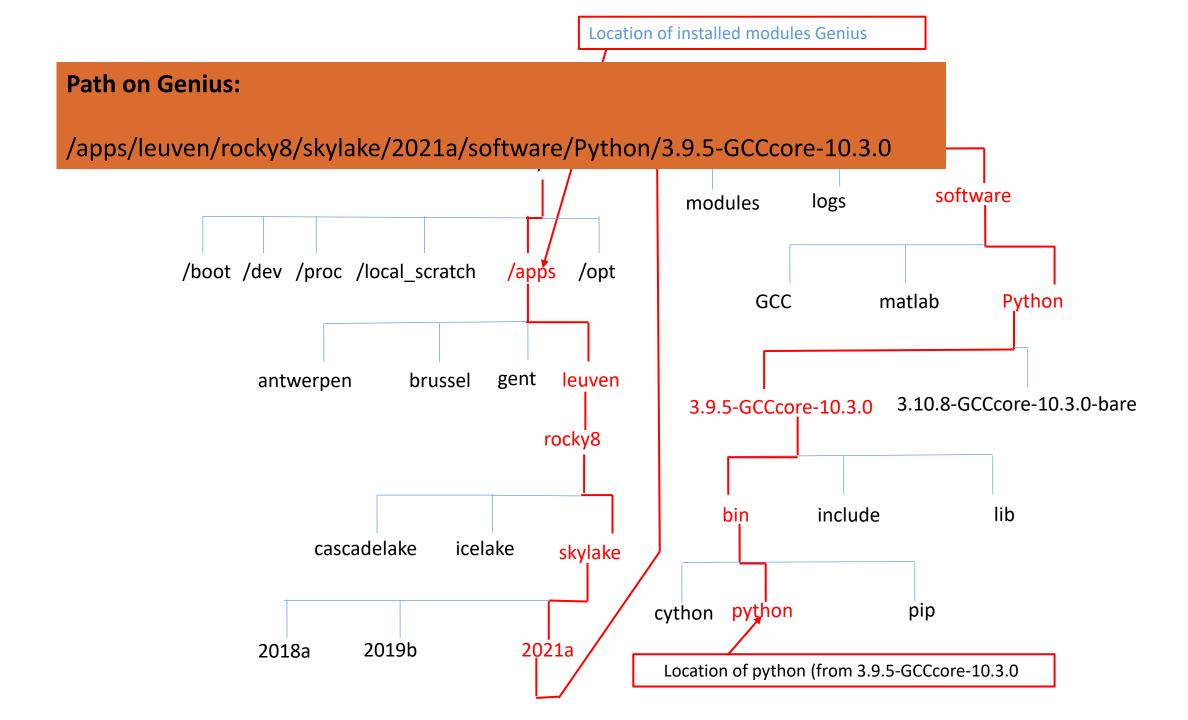

- Not to loose your job after closing your laptop:
  - Use NX GUI connection
  - Use command line + tmux
    - Start session: \$ tmux new -s test
    - **Detach session**: Ctrl+b+d (safe to go)
    - List session: \$ tmux ls
    - Reattach session: \$ tmux a -t test
    - Exit screen session (within tmux): \$ exit

### **Manage Windows and Session Tabs**

Ctrl+B C Create window

Ctrl+B W List Windows

Ctrl+B N Next window

Ctrl+B P Previous window

Ctrl+B F Find window

Ctrl+B, Name window

Ctrl+B & Kill window

### **Panes/splits**

Ctrl+B % Vertical split

Ctrl+B " Horizontal split

Ctrl+B O Swap panes

Ctrl+B Q Show pane numbers

Ctrl+B X Kill pane

Ctrl+B Arrow

Keys

Move to pane

- Not to loose your job after closing your laptop:
  - Use command line + screen
    - Start session: \$ screen -S test
    - Detach session: Ctrl+a+d (safe to go)
    - List session: \$ screen -ls
    - Reattach session: \$ screen -r test
    - Exit screen session (within screen): \$ exit

## Screen

- Create new window: ctrl-a c
- Go to previous/next window: ctrl-a p/n
- Go to window by number: ctrl-a <window-nr>
- Show current windows, move: ctrl-a ", <window-nr>
- Close window: ctrl-a K
- Detach screen: ctrl-a d
- List current screen sessions: \$ screen -ls
- Re-attach to session: \$ screen -r <session-id>
- Kill dead session: \$ screen -wipe
- Get help: ctrl-a?
- Monitor for activity: ctrl-a M (same to stop monitoring)
- Monitor for inactivity: ctrl-a \_ (same to stop monitoring)

## Screen

- Split screen horizontally: ctrl-a S
- Split screen vertically: ctrl-a |
- Go to next screen region: ctrl-a <tab>
- Remove current region: ctrl-a X
- Remove all but current region: ctrl-a Q
- Enter copy mode: ctrl-a [
- Paste: ctrl-a ]
- Dump window contents to file: ctrl-a h
- Enable logging: ctrl-a H
- Useful .screenrc file that eliminates some of screen's nuisances:
  - # Turn off that annoying start up message
  - startup\_message off
  - # Increase scroll back buffer to a more useful number of lines
  - defscrollback 10000

# Screen - settings

• In your .bashrc file

```
case ${TERM} in
    xterm)
echo "Hello terminal!!!"
;;
    screen)
echo "Hello screen!!!"
;;
esac
```

# Aliasing

- Alias Alternate name for a command(s)
- You can be inventive with it, but be careful
- If you log out from bash, your aliases will be purged!
- To define an alias permanently, put it in your .bashrc
- E.g.
   Image, your jobs always store the results in your scratch folder.
   So, you want an easy way to copy them to your data folder:

```
alias backup="cp -r $VSC_SCRATCH/results
$VSC_DATA/backup"
```

• To disable an alias, do:

unalias backup

## Alias and Unalias

- alias newname=oldname
  - eg. alias copy=cp
- Then we can use copy in the same way we use cp command
  - eg. copy file1 file2 //copies content of file1 to file2
- To remove alias use unalias command
  - unalias copy
- After this we cannot use copy to perform copying function

## Alias

Shells let you define command *aliases*: shortcuts for commands you use very frequently.

### Examples

```
alias la='ls -la'
```

Useful to always run commands with default arguments.

```
alias rmi='rm -i'
```

Useful to make rm always ask for confirmation.

```
alias data='cd /data/leuven/304/vsc30XXX'
```

Useful to replace very long and frequent commands.

```
alias schck='. /home/mag/env/chck.sh'
```

Useful to set an environment in a quick way (. is a shell command to execute the content of a shell script).

# which command

Before you run a command, which tells you where it is found

## ~/.bashrc file

#### ~/.bashrc

Shell script read each time a bash shell is started (login, or when the job starts on a compute node)

You can use this file to define

- Your default environment variables (PATH, EDITOR...).
- Your aliases.
- Your prompt (see the bash manual for details).
- A greeting message.

Do NOT put "module load" in your .bashrc. It creates conflicts

# bash configuration Files

- bash has two different login files.
  - .bashrc gets read when you open a local shell on a machine
  - .bash\_profile only gets read if and only if you login from a remote machine. Note that .bash\_profile itself reads in your .bashrc file as well.
- If you want aliases to be executed regardless, then you should put them in the .bashrc file.
- On the cluster please edit only .bashrc file in case of problem we can always allow you access thanks to correct .bash\_profile

# ~/.bash\_profile

- This is how your ~/.bash\_profile looks like
- Tip: never touch it

#### ~/.bash\_profile

```
# File: .bashrc #
# Description: A default .bashrc
###Source global defs ###
if [ -f /etc/bashrc ]; then
                                                  ### path manipulation ###
   . /etc/bashrc
                                                  # add ~/bin to the path,
fi
                                                  # cwd as well
                                                  PATH="$PATH:$HOME/bin:./"
###set the prompt ###
                                                  ### env variables ###
# uncomment out only one
                                                  # make sure that you
# this is hostname and time
                                                  # change this to your
PS1="\h-(\@): "
                                                  # username
# this is hostname and
                                                  MAIL="/afs/umbc.edu/users/u/s/username/Mail/inbox"
# history number
#PS1="\h-(\!)# "
                                                  export PATH
                                                  unset USERNAME
# this is hostname and
# working directory
                                                  ### User-specific aliases
#PS1="\h-(\w)# "
                                                  ### and functions ###
# this is hostname and
                                                  alias rm="rm -i"
# shortened working
# directory
#PS1="\h-(\W)# "
```

## **Environment Variables**

- Use the env command to see all environment variables
- set/export to see all shell variables
- Set or change environment variables from the command-line: new values last only for current login session.

```
sh/bash/ksh set: NEW_VARIABLE=newvalue
append: OLD_VARIABLE=$OLD_VARIABLEnewvalue
prepend: OLD_VARIABLE=newvalue$OLD_VARIABLE
add: OLD_VARIABLE=${OLD_VARIABLE}:newvalue
export OLD_VARIABLE
```

The order decides where system checks for command first (important if you have your own version and there is another vesion on the cluster)

## Introduction to bash

- The bash shell is one of the many shells that are available to you on the VSC nodes.
- Almost any installation of Linux defaults to the bash shell.
- bash is one of the many GNU.org (<a href="http://www.gnu.org">http://www.gnu.org</a>) projects.
- bash manuals:
  - A comprehensive online manual is provided at <a href="http://www.gnu.org/software/bash/manual/bashref.html">http://www.gnu.org/software/bash/manual/bashref.html</a>
  - Aliases <a href="http://www.gnu.org/software/bash/manual/bashref.html#Aliases">http://www.gnu.org/software/bash/manual/bashref.html#Aliases</a>
  - Controlling the Prompt <a href="http://www.gnu.org/software/bash/manual/bashref.html#Controlling-the-Prompt">http://www.gnu.org/software/bash/manual/bashref.html#Controlling-the-Prompt</a>

## Universal customization

• Universal .bashrc - written to run on all (relevant) clusters:

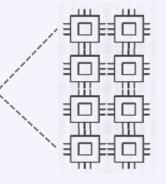

```
case ${VSC INSTITUTE CLUSTER} in
    wice)

## **Resource Glossary**

- Cluster: Which machine to use? Genius or wICE?
- Nodes: how many compute servers to request?
- Cores: how many cores per node to use?
- Memory requirement: how much memory each core needs?
- Partition: gpu, bigmem, superdome, amd
- Walltime: how long to use resources?
- Storage: how much storage (data, scratch, etc) the job needs?
- Credits: how many compute credits will be consumed?

### **Default Resources**

Cluster: the local machine you are logged into (Genius or wICE)

Nodes: 1

**Cores:** 1

RAM: depends on which node(s) you use

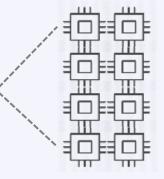

**Partition:** batch

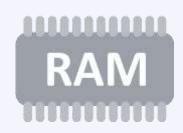

Walltime: 1 hour

Storage: no default

Credits: no default

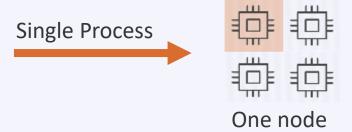

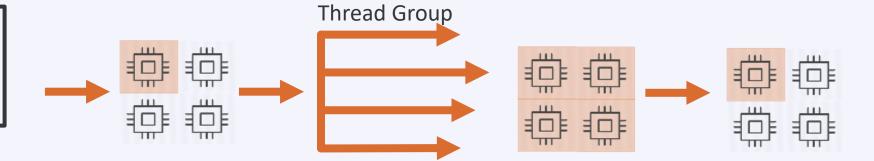

#### **Serial Application**

(1 process on 1 core)

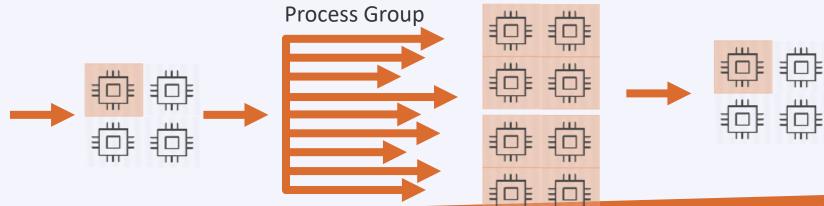

#### Multi-Core Appl.

(N threads on N cores from **1 node**)

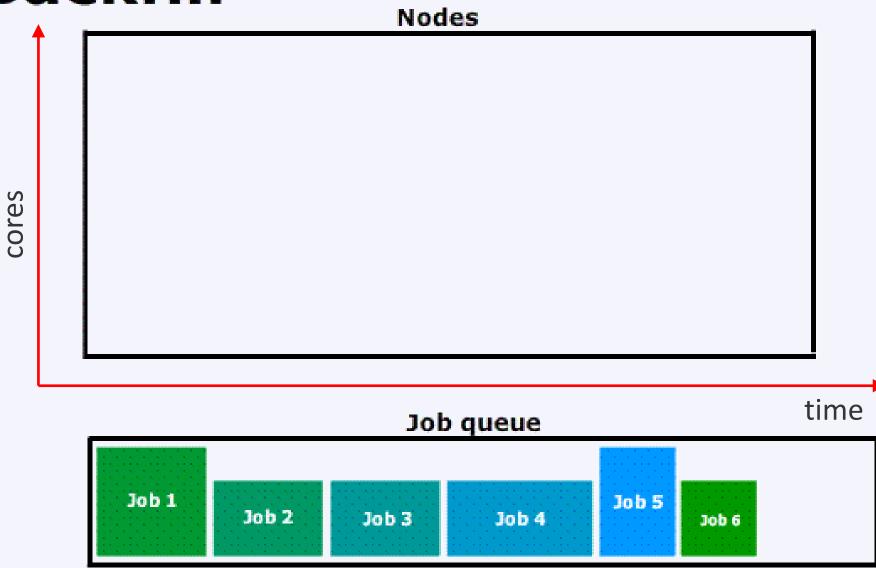

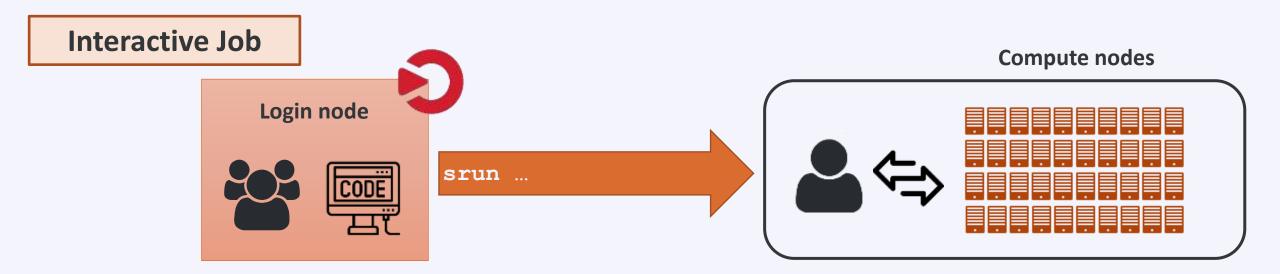

#### **Distributed Appl.**

(many processes on multiple cores/nodes)

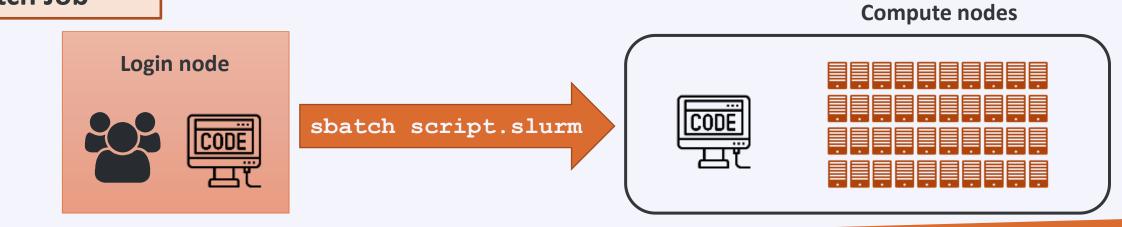

# **Backfill**

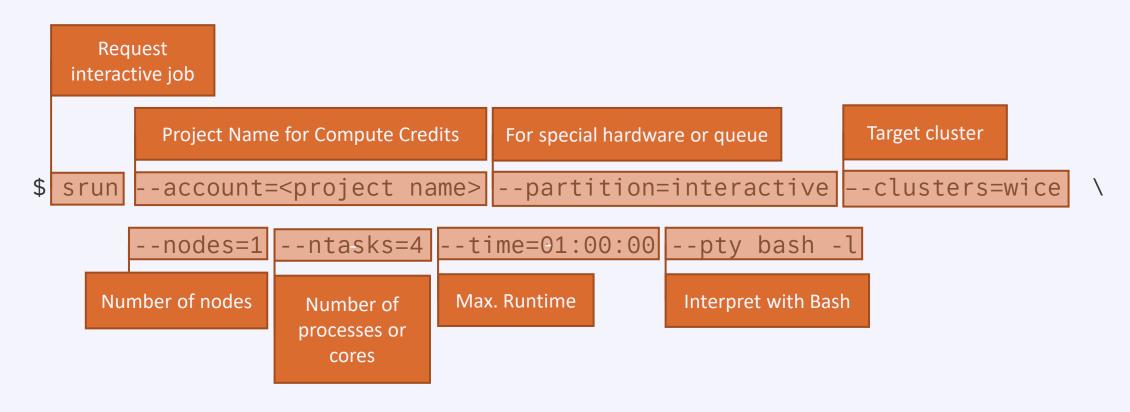

#### Interactive Job on wICE

Remark

- Specifying <project name> for credits is mandatory, e.g.: -A lp\_hpcinfo
- ☐ Implicit defaults for an interactive job on wICE are: -n 1, -t 01:00:00, --mem-per-cpu=2000M

Command	Purpose
\$ sbatch	Submit a batch job
\$ srun	Submit an interactive job
<pre>\$ scancelcluster=wice <jobid></jobid></pre>	Cancel a specific pending or running job
<pre>\$ scontrol show jobclusters=wice <jobid> \$ slurm_jobinfo <jobid></jobid></jobid></pre>	Detailed job info (very useful to diagnose issues)
<pre>\$ squeueclusters=wicelong</pre>	Status of all recent jobs
<pre>\$ squeueclusters=wicestart</pre>	Give a rough estimate of start time
<pre>\$ sinfoclusters=wice</pre>	Info about the state of available partitions and nodes
<pre>\$ sacctclusters=wicebatchjob <jobid></jobid></pre>	Show minimal info about a queue or partition (-p)
\$ slurmtop	Overview of the cluster
<pre>\$ scontrolclusters=wice show node <hostname></hostname></pre>	Get detailed information about the status of a node
<pre>\$ sam-balance</pre>	Overview of all your available credit projects
<pre>\$ sam-list-allocations</pre>	Detailed overview of your credit allocation history

	account= <account_name></account_name>	

# **Argument Shorthands**

Some (not all) of the sbatch, srun and salloc command line arguments have shorthands

Shorthand	Full Argument	Meaning
-A	account	Slurm account name
-a	array	Job array range
-M	clusters	Machine or cluster name
-c	cpus-per-task	Num cores per task (default=1)
-d	dependency	Job dependency (after, afterok, afterany,)
-I	input	STDIN filename
-e	error	STDERR filename
-0	output	STDOUT filename
-t	time	Maximum walltime
-N	nodes	Minimum num nodes
-n	ntasks	Maximum num tasks
-p	partition	Partition name

#### **Interactive Jobs**

Interactive job: 1 core for 1 hour (default)

```
$ srun --clusters=wice --account=lp hpcinfo --pty /bin/bash -1
```

Interactive job with X-forwarding

```
$ srun --clusters=wice --account=lp hpcinfo -x11 --pty /bin/bash -l
```

Request fraction of a node from interactive partition

Request a GPU accelerator

To join a running job

```
$ sattach <JobID>.<StepID> # e.g. 55439251.0
```

#### Example Slurm Job Script

```
jobscript.slurm
                                                        Shebang
#!/bin/bash -1
#SBATCH --clusters=wice
#SBATCH --account=lp hpcinfo
#SBATCH --nodes=1
#SBATCH --ntasks=4
                                                      Resource List
#SBATCH --mem-per-cpu=3400M
#SBATCH --job-name=hpc workflow
#SBATCH --mail-type=BEGIN, END, FAIL
#SBATCH --mail-user=my.name@kuleuven.be
module load intel/2021a
                                                      Module load(s)
module load Python/3.9.5-GCCcore-10.3.0
which python3
cd $VSC SCRATCH/projects/simulations
                                                       Move data
cp -r $VSC DATA/input data .
python modelling.py
                                                      Execute commands
cp -r output data $VSC DATA
                                                       Move data
rm -rf ./input data ./output data
```

```
#!/bin/bash -1
```

**Command Line** 

```
$ sbatch simulation.slurm
```

JobID

Submitted batch job 60042478 on cluster wice

stderr, stdout

```
$ ls *.out
slurm-60042478.out
```

- Submit the job to the batch server
- Receive a unique JobID
- Error and output files

#### **Output File**

- STDERR and STDOUT are by default redirected to a single file:
- slurm-<JobID>.out
- Contains job info, all errors and warnings, and printouts
- Always study it
- Address all warnings and errors (if you can)
- Typical error examples ...

#### STDOUT + STDERR

```
$ ls slurm-*.out
slurm-60042478.out
```

#### Out of Memory

slurmstepd: error: Detected 1 oom-kill event(s). Some of your processes may have been killed by the cgroup out-of-memory handler.

#### Short Walltime

```
slurmstepd: error: *** JOB 60042478 ON s28c11n2 CANCELLED AT 2023-02-08T10:03:43 DUE TO TIME LIMIT ***
```

Low Disk Space

IOError: [Errno 122] Disk quota exceeded

#### **Output File**

- Always created
- ✓ slurm-<job\_id>.out
- Contains all standard output and error (instead of screen)
- Always study it
- Standard Output and Error channels can be redirected to other files:

```
#SBATCH --output ...
#SBATCH --error ...
```

stdout

```
$ ls slurm-*.out
slurm-60041238.out
```

#### **Output File**

```
SLURM JOB ID: 60033947

   StdIn=/dev/null
   StdOut=/vsc-hard-mounts/leuven-data/3../vsc3.../Odonate SOM/slurm-60049330.out
```

Diagnosis

Why is my job in pending/hold state?

Check out the "Reason" on Slurm docs: <a href="https://slurm.schedmd.com/resource\_limits.html">https://slurm.schedmd.com/resource\_limits.html</a>

#### Interactive Partitions

- Accessible via command line and Open OnDemand
- To quickly compile, test, debug your (parallel) application
- To pre-/post-process your data and make visualizations
- Short queue time
- 12 nodes on Genius: 36 cores/node, 192 GB mem
- 4 nodes on wICE: 64 cores/node, 512 GB mem, 1 GPU (=7 GPU instances)
- Max resource per user: 8 cores, 1 GPU instance, 16 hour walltime
- Free of charge

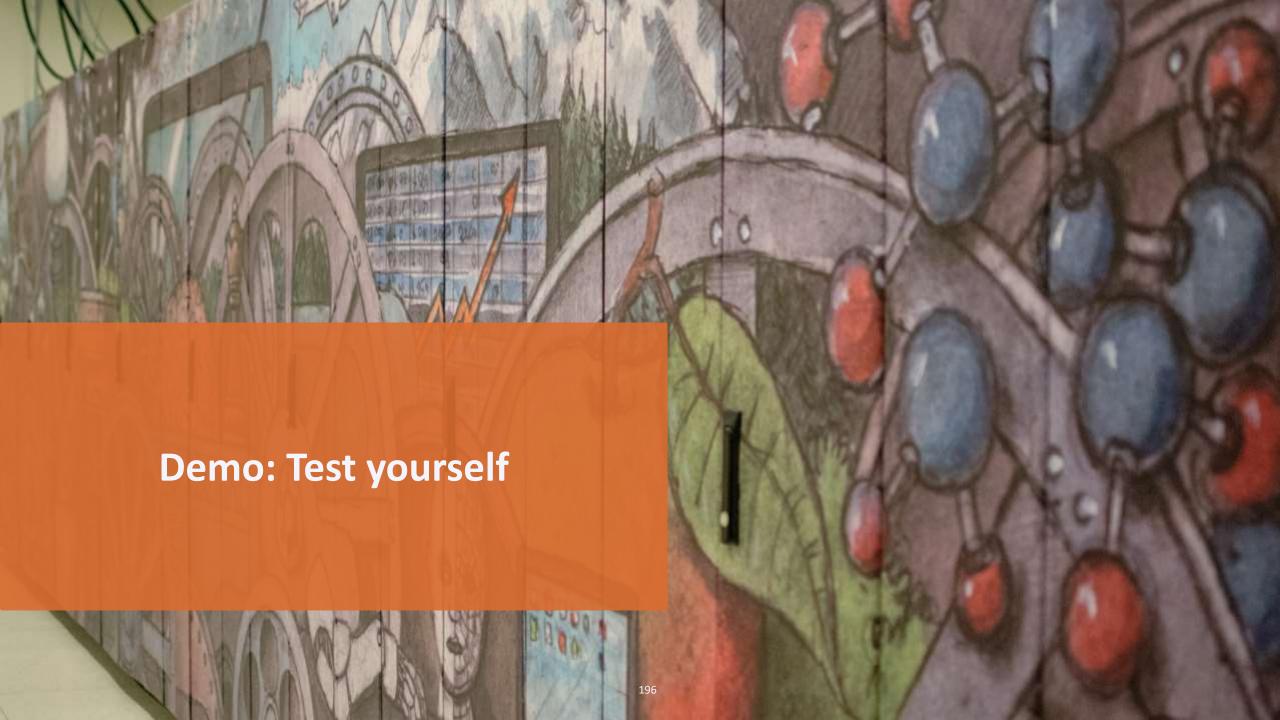

Interactive Job

```
$ srun --account=lp_myproject --clusters=wice \
    --partition=interactive --nodes=1 --time=16:00:00 \
    --gpus-per-node=1 --pty bash -l
```

# **Debugging Partitions**

- Accessible via command line and Open OnDemand
- Quickly test if your (parallel) application works
- Short queue time
- Only one job at a time, max walltime: 1 hr

Cluster	Partition	Resources
Genius	batch_debug	2x Cascadelake
	gpu_p100_debug	1x Skylake node (4x P100 GPUs)
wICE	interactive	4x Icelake (1x A100 GPU)
	gpu_a100_debug	1x Icelake (4x A100 GPUs)

## Basics

- Request membership to lp\_hpcinfo group (account.vscentrum.be)
- ✓ Login via OpenOnDemand: <a href="www.ondemand.hpc.kuleuven.be">www.ondemand.hpc.kuleuven.be</a>
  Features: File transfer, File editor, interactive apps, Jobs' overview
- Check disk quota:

```
$ myquota
```

Check the credits

```
$ sam-balance and $ sam-list-allocations
```

♥Software modules:

```
$ module {avail|list|load|unload|purge}
```

# Demo/test yourself

- Copy training material /apps/leuven/training/HPC\_intro/ to your \$VSC\_DATA
- Submit cpujob to the cluster
- List all your jobs squeue -M wice
- Check the information about the cpujob slurm\_jobinfo -M wice <job\_ID>
- Modify the mpi.slurm script to request 1 node, 72 cores for 30 minutes and get the notification about job start/end by e-mail
- Check the status of all the jobs
- ♥ While the job is running get the information about the node <code>slurm jobinfo...</code>

#### Demo - monitoring

Submit an interactive job

Run your program on a compute node

Open a new terminal and ssh to a compute node

Check the resources usage (htop)

#### demo – conda installation

- Start an interactive job on Genius or wICE srun -M genius -A <account> -n 1 --pty /bin/bash -l
- **♥ Install miniconda in your** \$VSC DATA **directory**
- \$ wget https://repo.continuum.io/miniconda/Miniconda3-latest-Linux-x86\_64.sh \$ bash Miniconda3-latest-Linux-x86\_64.sh -b -p \$VSC\_DATA/miniconda3
  - Add a PATH to conda:
- \$ export PATH="\${VSC\_DATA}/miniconda3/bin:\${PATH}"
  - ♥ Check if conda is added to your \$PATH (\$ which conda)
  - Add it to \$PATH in your .bashrc
- \$ echo 'export PATH="\${VSC\_DATA}/miniconda3/bin:\${PATH}" ' >> .bashrc

#### demo – conda usage

- Create a conda environment including Jupyter
- \$ conda create -n science jupyter numpy scipy
- Activate this environment
- \$ source activate science
- Add matplotlib package to this environment
- \$ conda install matplotlib
- Return to original environment
- \$ conda deactivate
